1.0 INTRODUCTION

BA Group has been retained by South Service Holding Corp. (the "**Applicant**") to provide transportation consulting services for a Draft Plan of Subdivision application to permit the redevelopment of 420-468 South Service Road East, in the Town of Oakville (the "**Site**"). The Site location is illustrated in **Figure 1.**

1.1 Existing Site

The Site is located in Midtown Oakville, on the east side of Trafalgar Road, between the Queen Elizabeth Way (QEW) / Highway 403 corridor (referred to herein as the "**QEW**") and the Metrolinx / CN rail corridor, and west of the existing Royal Windsor interchange with the QEW.

The Site is bounded by South Service Road East to the north, the Metrolinx / CN rail corridor to the south, and other industrial uses to the west and east. Vehicle access is currently provided via South Service Road to the north and Davis Road to the west. The Site has an approximate area of 11 ha (110,889 m^2), with an approximate frontage of 374 metres along South Service Road East. The Site was formerly occupied by the GE Lighting Lamp Plant, which was closed in 2010.

The Site remained vacant until earlier in 2024, when temporary land use approvals were granted for an outdoor storage use. A concept plan for the temporary outdoor storage use is provided in **Appendix A**. The outdoor storage includes the following three separate areas:

- An area dedicated to the deployment of prefabricated metal shipping containers (2.5 m wide by 6.1 m long), placed side-by-side and back-to-back to form individual outdoor storage units, forming double-sided rows;
- An area that would accommodate the outdoor storage of passenger-sized vehicles; and
- An area that would accommodate the outdoor storage of larger vehicles such as recreational vehicles (RV's), single unit trucks, personal trailers such as boats trailers or general-purpose trailers.

Access to the Site for the temporary uses is provided via three driveways:

- Two driveways along South Service Road at existing driveway locations, generally located to the west and east of the planned temporary uses.
- An emergency access driveway that is closed during normal operations, at the east end of Davis Road, where Davis Road terminates at the western Site boundary. This does not change the existing conditions on Davis Road.

There is also a small passenger vehicle parking area (15 customer parking spaces that meet the Town of Oakville's Zoning Bylaw dimensions), near the entrance via the western Site access driveway on South Service Road. All areas for the temporary uses that accommodate vehicle maneuvering will be appropriately "hardscaped" to align with the Town of Oakville Zoning Bylaw requirements. The general storage area is an existing hard-surfaced area. Access to the Site will be provided 24 hours a day via the gate-controlled points of entry.

The Site is currently surrounded by a range of uses including existing small scale industrial buildings, an existing hotel and two office buildings. The temporary uses, as noted above, include access from an existing public street system that relies upon the following:

- South Service Road East as its primary point of access to / from Trafalgar Road to the west and Royal Windsor Drive to the east;
- Connections to the QEW via Royal Windsor Drive and other public streets that surround the Ford Assembly Plant to the northeast; and
- Chartwell Road to the east that includes an at-grade crossing of the Metrolinx/CN rail corridor and connects to Cornwall Road to the south.

1.2 Background

The Site is located in Midtown Oakville which has been identified for intensification through the Midtown Oakville Growth Area Review. The Midtown Oakville Context is illustrated in **Figure 2.**

The Midtown Oakville plan includes a series of new, proposed public streets and multi-modal transportation infrastructure that connects Midtown Oakville to north of the QEW corridor, south of the rail corridor, east-west across Trafalgar Road and east to the proposed improved Royal Windsor interchange with the QEW.

An OPA application for the Site was first submitted to the Town of Oakville in November 2024 for a mixed-use master planned community. As part of that application, BA Group prepared a transportation study titled "*420-468 South Service Road East, Proposed Mixed-Use Development, Urban Transportation Considerations*" dated November 2024.

The Site Master Plan was subsequently revised in response to Town, public and other stakeholder comments, and a revised OPA and ZBA application was made to the Town in October 2025. As part of that application, BA Group prepared a report titled "*420-468 South Service Road East, Proposed Mixed-Use Development, Urban Transportation Considerations*" dated October 2025. The Town has since provided comments on the revised application.

On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-073 and Zoning By-law 2026-074 which amended the in-force Liveable Oakville Plan (OPA 83) and the in-force Town of Oakville Zoning By-law 2014-014, respectively. The site-specific bylaws permit residential and mixed uses on the Site, establish maximum heights (38 stories) and densities, establish future public road right-of-way widths, and introduce site-specific requirements on built form, massing, parkland, vehicle parking, bicycle parking and other policies.

The Site Master Plan has since been revised to respond to the requirements of the site-specific zoning bylaws as well as Town comments. A Draft Plan of Subdivision application is now being made to establish the development blocks, public street network and conceptual phasing plan. The transportation elements of the Site Master Plan generally remain the same as the October 2025 application – including the proposed public street network, block structure, open space network, site accesses, internal site circulation, and parking and loading arrangements. A key change, from a traffic impact perspective, is a reduction in maximum tower heights across the Site from 48 stories to 38 stories, which in turn decreases the total development floor area.

The revised Site Master Plan does not contain a detailed breakdown of unit counts or non-residential GFA, as the site-specific zoning bylaw does not govern the maximum number of units or GFA, but rather the maximum tower heights, built form and massing. Based on information provided by Graziani + Corazza Architects, this traffic impact assessment conservatively assumes an approximately 19.4% reduction in residential units from the October 2025 submission, i.e. from 6,945 to 5,600 units. The non-residential GFA from the October 2025 submission is assumed to remain the same, i.e. 9,118 m^2 of ground floor commercial uses.

As a result of the reduction in the number of residential units, the traffic generation of the development will decrease. This report has been updated to reflect the reduced number of residential units and to address all comments provided by the Town, Region and the Ministry Transportation Ontario (MTO).

A comparison between the October 2025 and the current development proposal is provided in **Table 1**. The proposed Site master plan is illustrated in **Figure 3.** Reduced scale architectural ground floor and parking level plans are provided in **Appendix B**.

A comparison of the October 2025 and proposed Site Master Plans is provided in **Figure 4**.

Key revisions to the master plan include:

- A reduction in maximum tower heights across the Site from 48 stories to 38 stories;
- A reduction in the number of residential units from 6,945 to 5,600;
- A refinement in the placement of towers and podiums across the development blocks; the tower locations remain generally the same;
- A refinement in the arrangement of the open spaces, while maintaining the overall open space strategy;
- A minor shift in proposed driveway locations on Davis Road to respond to the revised arrangement of buildings and open spaces; and
- Moving the existing GE building in the northwest quadrant of the Site south from the 14m MTO setback and into the Site, and introducing a circular driveway to provide emergency vehicle, pick-up/drop-off and servicing access to the building.

Other transportation elements of the Site Master Plan remain the same, including:

- The overall block structure of the Site, including four development quadrants defined by the new public road network;
- The alignment, right-of-way and functional design of the new public street network;
- The proposed site accesses onto the public street network. As discussed above, the locations of the proposed driveways on Davis Road have been slightly shifted to respond to the revised arrangement of buildings and open spaces, but the overall access arrangements remain the same;
- The internal site circulation including pedestrian circulation, pick-up/drop-off and parking access arrangements;
- The loading arrangements; and
- The vehicle and bicycle parking arrangements.

Table 1 Comparison of Development Proposal and October 2025 Submission

Land Use	October 2025 Development Proposal	Current Development Proposal	Net Change
Block 1			
Residential	2,220 units	1,800 units	**-420 units**
Retail	1,550 m²	1,550 m²	**--**
Block 2			
Residential	2,156 units	1,750 units	**-406 units**
Retail	1,550 m²	1,550 m²	**--**
Block 3			
Residential	1,305 units	1,050 units	**-255 units**
Retail	3,293 m²	3,293 m²	**--**
Block 4			
Residential	1,264 units	1,000 units	**-264 units**
Retail	2,808 m²	2,808 m²	**--**
Total Site			
Residential	**6,945 units**	**5,600 units**	**-1,345 units**
Retail	**9,118 m²**	**9,118 m²**	**--**

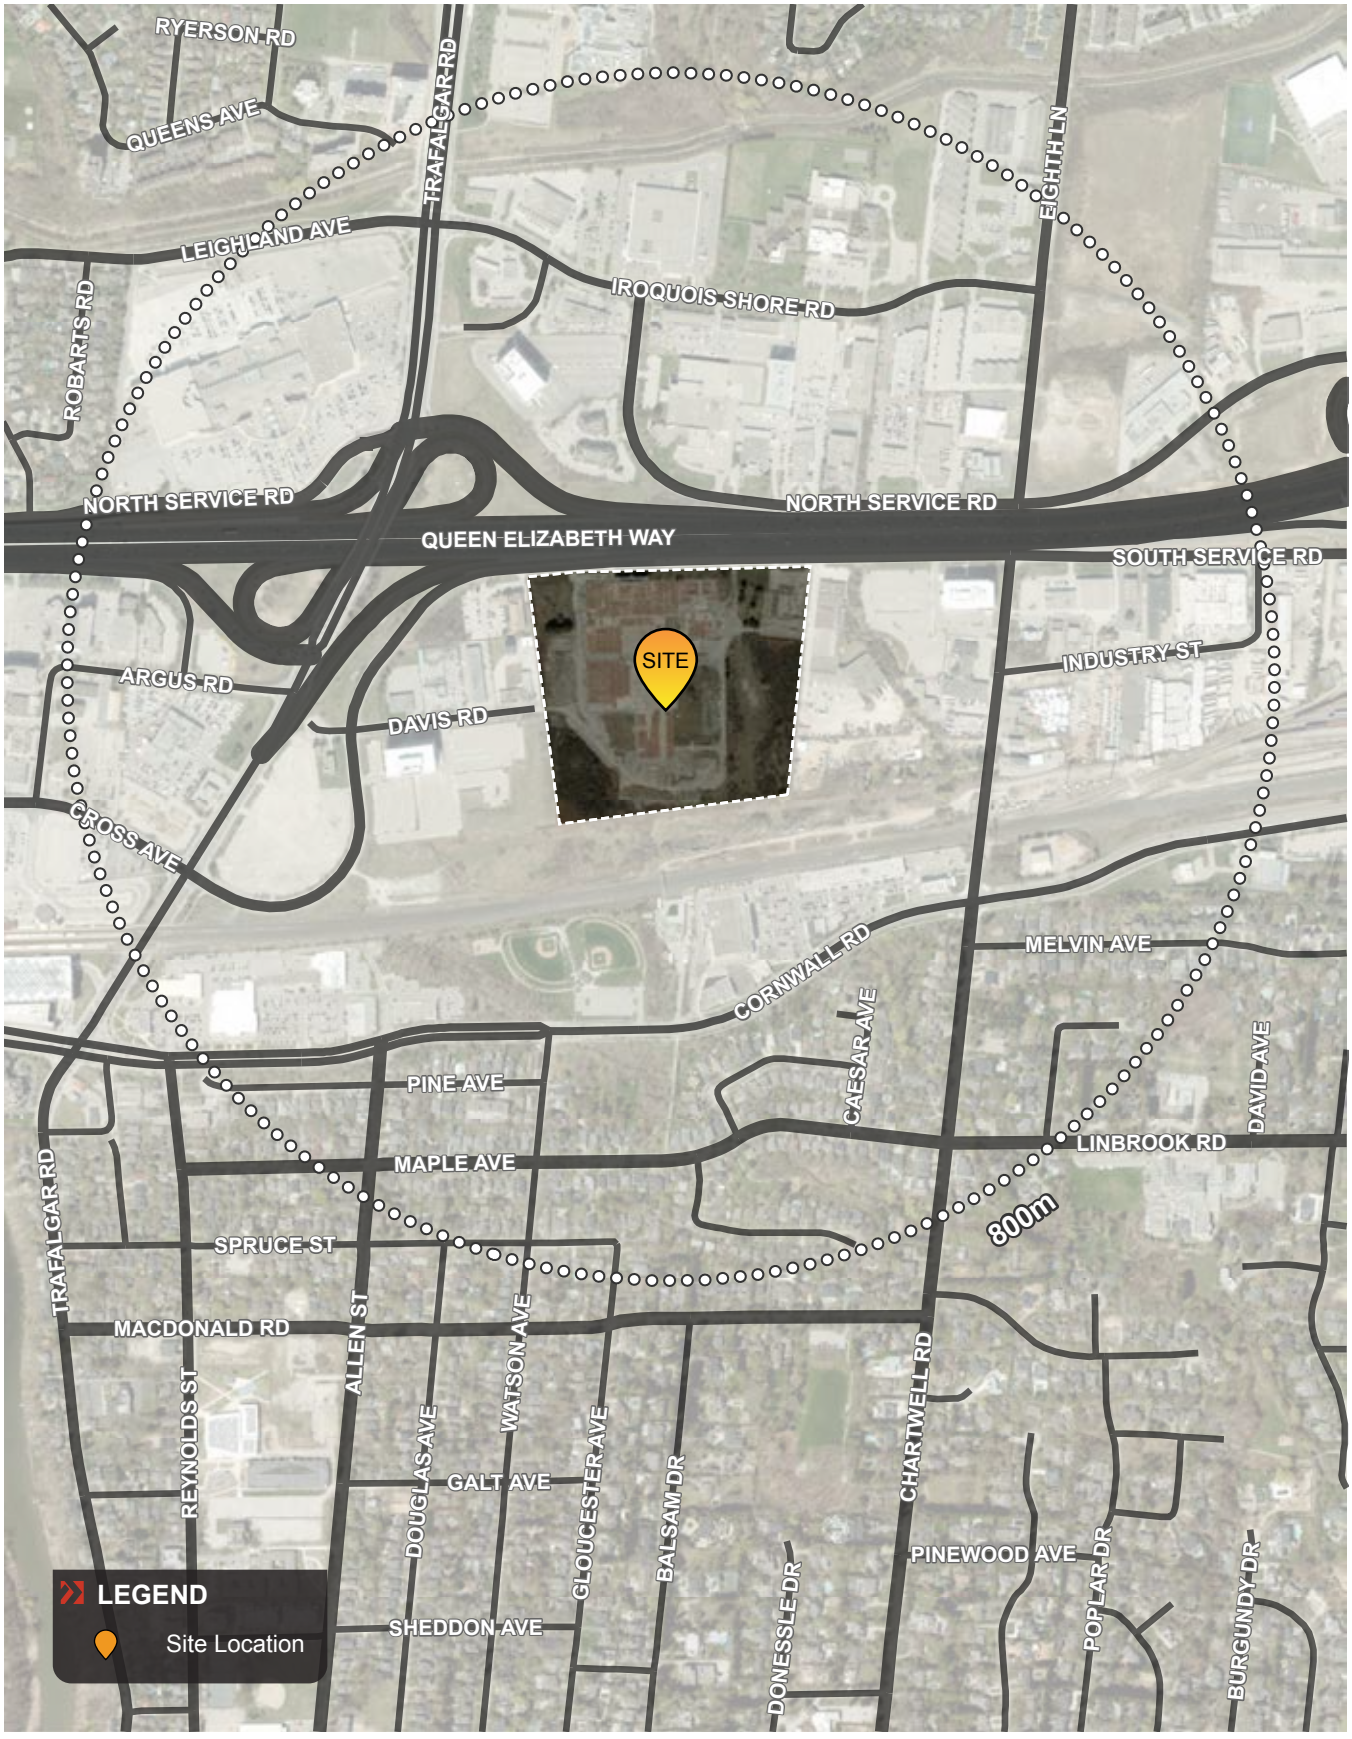
1.3 Proposed Site Master Plan

The proposed mixed-use development ("Development Proposal" or "Site Master Plan") includes four blocks with an assumed total of 5,600 residential units and 9,118 m² GFA of retail. The adopted breakdown of uses across each development block is summarized in **Table 2**.

Pedestrian access and circulation will be provided throughout all four development blocks, with connectivity to the surrounding street network. This ensures direct and convenient access to and from all new public streets, as well as to planned transit service on the New N-S Arterial Street and Cross Avenue that will connect to the Oakville GO Transit hub. The development blocks will also include private pedestrian linkages throughout for each residential building and non-residential retail spaces within the Site. The retail spaces will be located at-grade, along the frontage of the east-west collector street (Davis Road), through the centre of the mixed-use development. This is consistent with the uses anticipated along "Primary" and "Secondary" main streets in the Midtown area.

Cycling infrastructure is also planned for the Site, including dedicated bicycle parking rooms for long-term bicycle uses (i.e. resident and employee bike parking), with a mix of internal and external bicycle parking for short-term bicycle uses (i.e., resident visitor and non-residential visitor bicycle parking). The provision of convenient and

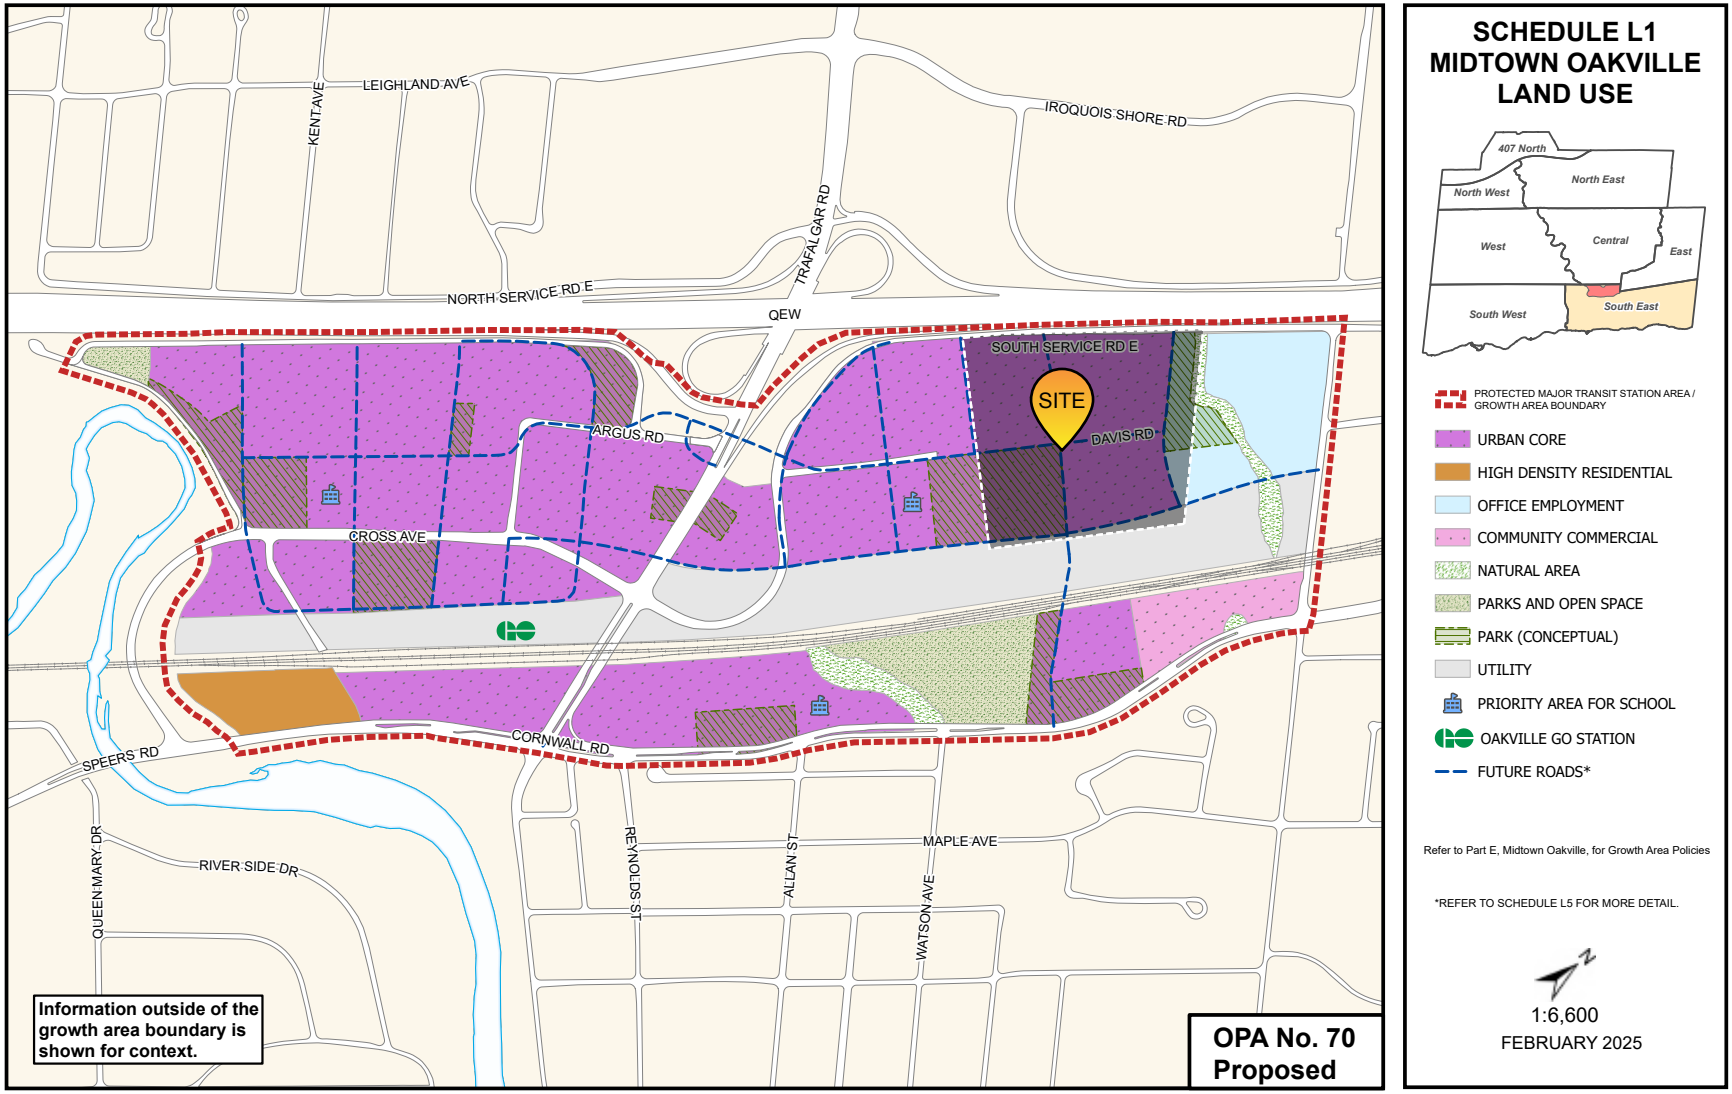
direct connections for cycling facilities planned within the new public streets in Midtown, will link the Site to the multi-modal transportation network being created throughout Midtown Oakville and the broader Town of Oakville.



Vehicle parking will be provided within below-grade parking facilities for each residential block. A series of at-grade facilities for pick-up and drop-off, service vehicle loading areas and emergency vehicle access, will also be provided to ensure the Site will be appropriately serviced and connected to the planned public transportation systems within Midtown Oakville.

Table 2 Summary of Current Development Proposal

Land Use / Type	Block 1	Block 2	Block 3	Block 4	Total
Residential (units)	1,800	1,750	1,050	1,000	**5,600 units**
Retail (GFA)	1,503 m²	1,514 m²	3,293 m²	2,808 m²	**9,118 m²**



Notes:

1. Site statistics based on site plans prepared by Graziani + Corazza Architects, dated September 18, 2026.

FIGURE 4 COMPARISON OF CURRENT AND OCTOBER 2025 MASTER PLANS

2.0 TRANSPORTATION NETWORK & POLICY SUMMARY

2.1 Key Policy Updates

2.1.1 Oakville Transportation Master Plan

Oakville Town Council approved the final 2025 Transportation Master Plan on October 6, 2025. The focus of the TMP is to provide a multi-modal transportation network, with a focus active transportation and transit, in order to provide a range of travel options to manage growth and mitigate congestion in the Town.

> "*The TMP will focus on building walkable, cycle and transit friendly neighbourhoods integrated with accessible transportation choices for all residents. The TMP will recommend a comprehensive, updated set of guidelines to enhance the Town's transportation system to address the needs of all stakeholders and establish a path forward for all modes of transportation to support Oakville's vision to be a vibrant and livable community for all*."

The 2025 Oakville TMP recommended street network is illustrated in **Figure 5** (Figure 7-2 in the TMP). Note that the TMP road network includes the extension of Cross Avenue from west of Trafalgar Road to the Royal Windsor Drive interchange at the QEW and the connection of Argus Road to Davis Road, below Trafalgar Road.

2.1.2 Midtown Transportation Plan

The Midtown Transportation Plan, with the Midtown Implementation Program, dated March 19, 2026, was undertaken by R.J. Burnside and Associates. The purpose of the Midtown Transportation Plan is as follows:

> "*to guide infrastructure and policy decisions that will support the growth of Midtown Oakville to 2051. The study area includes the 103-hectare Midtown OPA boundary and an expanded transportation-specific study area encompassing key corridors such as Trafalgar Road, Speers/Cornwall Road, and the Royal Windsor Interchange."*

The Midtown Transportation Plan process informed the Town of Oakville Midtown Official Plan Amendment and confirmed the recommended transportation network, new infrastructure and policies related to the transportation system and land use planning and climate change mitigation implications.

The Midtown Transportation Plan satisfies Phases 1 and 2 of the Municipal Class Environmental Assessment (MCEA) process and will inform future Schedule B and C projects. The previous Midtown Class Environmental Assessment was approved in 2014, hence the Midtown Transportation Plan builds on the 2014 plan and identifies next steps, including requirements related to the Environmental Assessment (EA) process.

The Midtown Transportation Plan developed and evaluated the following 4 alternative solutions, to address Midtown's transportation challenges:

- **Previously Planned / "Business as Usual"**: includes committed and planned projects and serves as a baseline for comparison.
- **Road Expansion Focused**: Prioritizes new road capacity, including additional crossings and widenings.

- **Transit and Active Transportation Focused**: Emphasizes sustainable modes with enhanced transit and active transportation policies.
- **Balanced Solution**: Integrates road, transit and active transportation improvements, to serve all users.

Each option was assessed and evaluated with travel demand modelling and considered transportation service, equity, climate change mitigation, environmental impact and cost. The Midtown Transportation Plan concluded that the preferred option is the "Balanced Solution", as this option will be able to appropriately accommodate the travel demand expected to be generated by the growth in both Midtown area and across the Town, and balances mobility and sustainability. The "Balanced Solution" (Preferred Solution) considers all planned and committed projects from the previous 2014 Midtown Environmental Assessment, Midtown OPA, Oakville Transit Five-Year Business Plan, Metrolinx 2041 Regional Transportation Plan and Halton Region Integrated Master Plan (ongoing).

The recommended road network phasing (Figure E-2 in the Midtown Transportation Plan) is provided in **Figure 6**.

2.1.3 Draft Midtown Oakville Official Plan Amendment (2025)

The Town adopted the 2024 Midtown Oakville Official Plan Amendment (OPA 70) ("Draft Midtown Oakville OPA") at its February 18, 2025 Planning and Development Council meeting. The OPA will be sent to the Ministry of Municipal Affairs and Housing for final review and approval. While the OPA is under review by Ministry, the Town will continue public consultation regarding Midtown policy implementation tools.

The Midtown Implementation Area is illustrated in **Figure 7**. The future transportation network included within the Midtown OPA (Schedule L-5), is illustrated in **Figure 8**.

2.1.4 Broader Midtown Oakville Street Network

The broader Midtown Oakville street network includes considerations for both the Midtown Oakville OPA transportation network, as well as the Midtown EA. In addition to the proposed network included within the Midtown Oakville OPA, the broader Midtown Oakville street network includes the following:

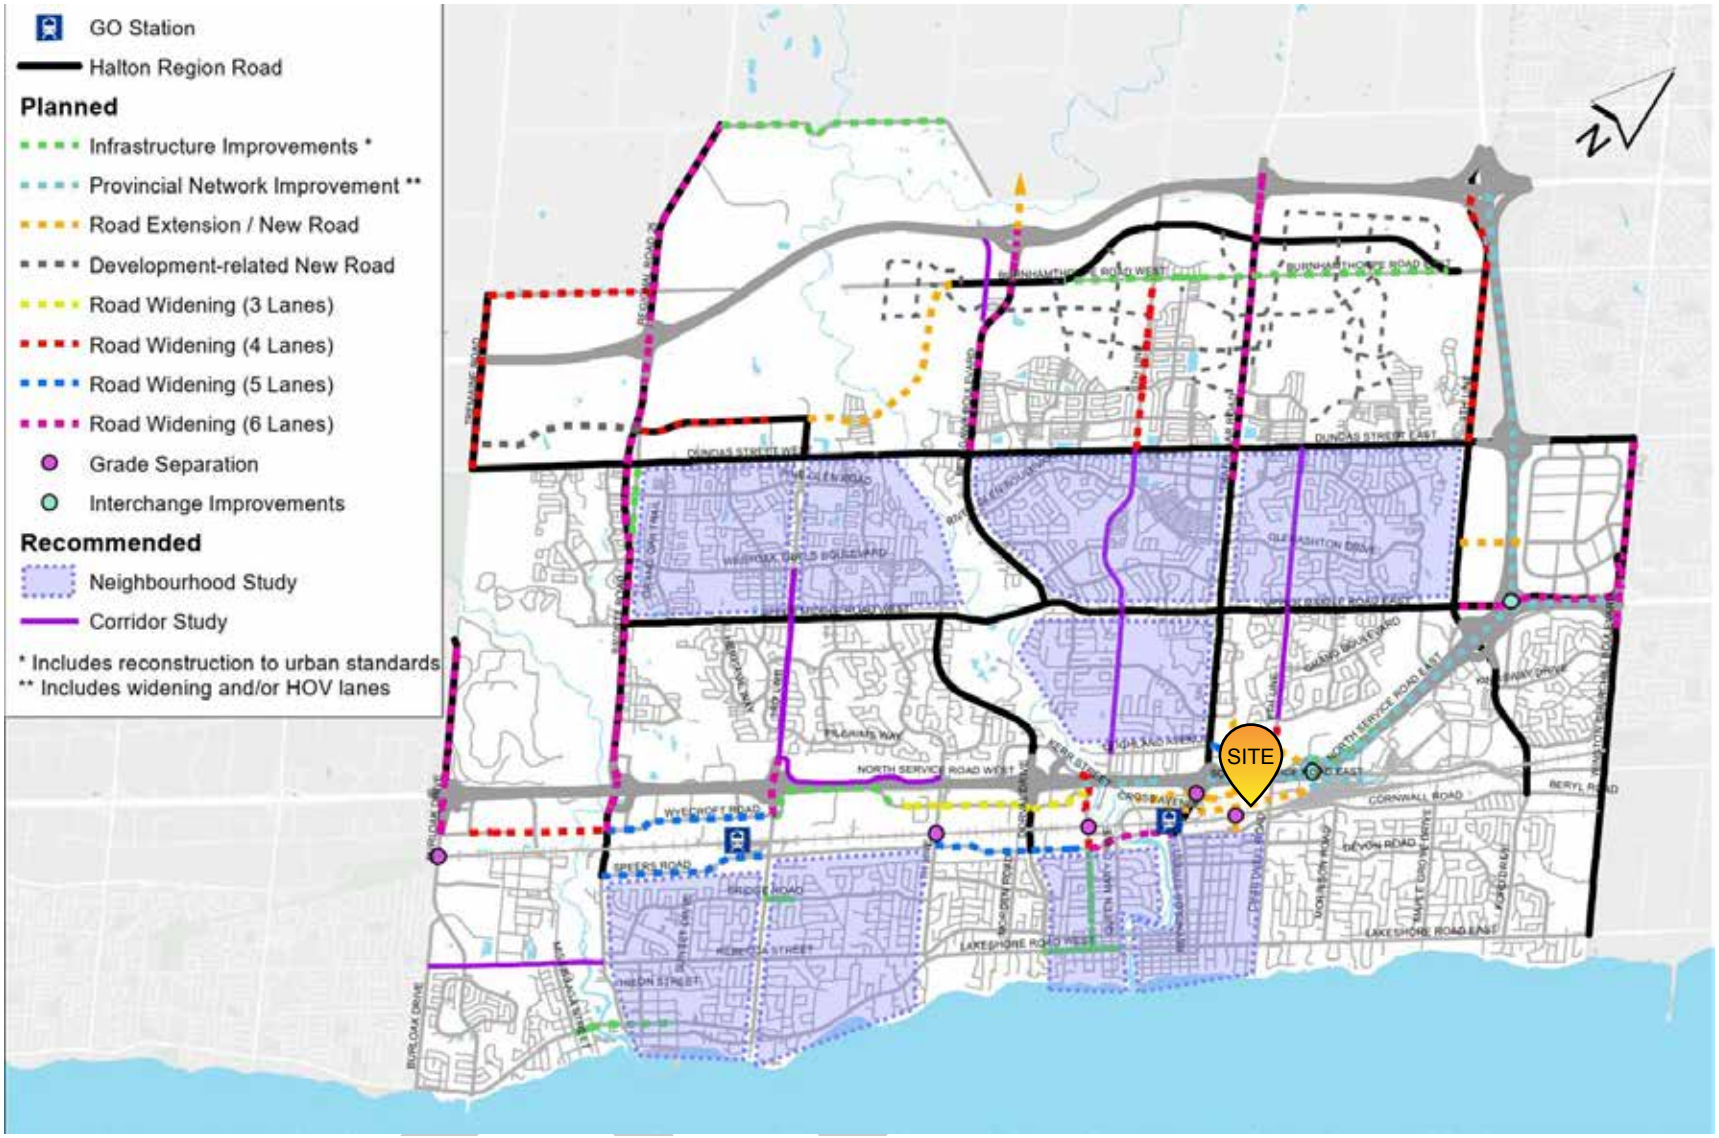
- Cross Avenue extends from Trafalgar Road to Royal Windsor Drive, connecting with the enhanced QEW interchange.
- A direct route from eastbound QEW to Midtown Oakville is provided via a new off-ramp to Cross Avenue at the Royal Windsor Drive interchange. A new westbound QEW off-ramp at Royal Windsor Drive will offer an alternative route to Midtown Oakville and surrounding areas. The new QEW ramps at Royal Windsor Drive will accommodate the additional travel demand from Midtown Oakville's planned intensification and offer relief to the existing Trafalgar Road interchange.

The routing options provided by the planned Midtown Oakville street system will be essential for all modes of travel between future development blocks, external point of access and egress related to Midtown Oakville and the Protected Major Transit Station Area (PMTSA) (the Oakville GO Station Hub), that includes Metrolinx's GO Rail and GO Bus stations and the Oakville Transit Terminal.

Note that the traffic analysis undertaken for this report considers the broader Midtown Oakville street network. Given the long-term perspective of the Midtown OPA approval review and the long-term future study horizon (2044), the QEW ramp network improvements have been assumed to be in place as part of the future conditions

for the traffic analysis within this report. Similarly, the planned full local, collector and arterial street network has been assumed to be in place for the traffic analysis, in order to assess the long-term travel demand impacts for the area.

Although the Midtown Oakville EA notes that the planned roadway improvements will provide relief to the existing and future traffic operations, it is recognized that capacity constraints will continue to remain the overall vehicle transportation network.

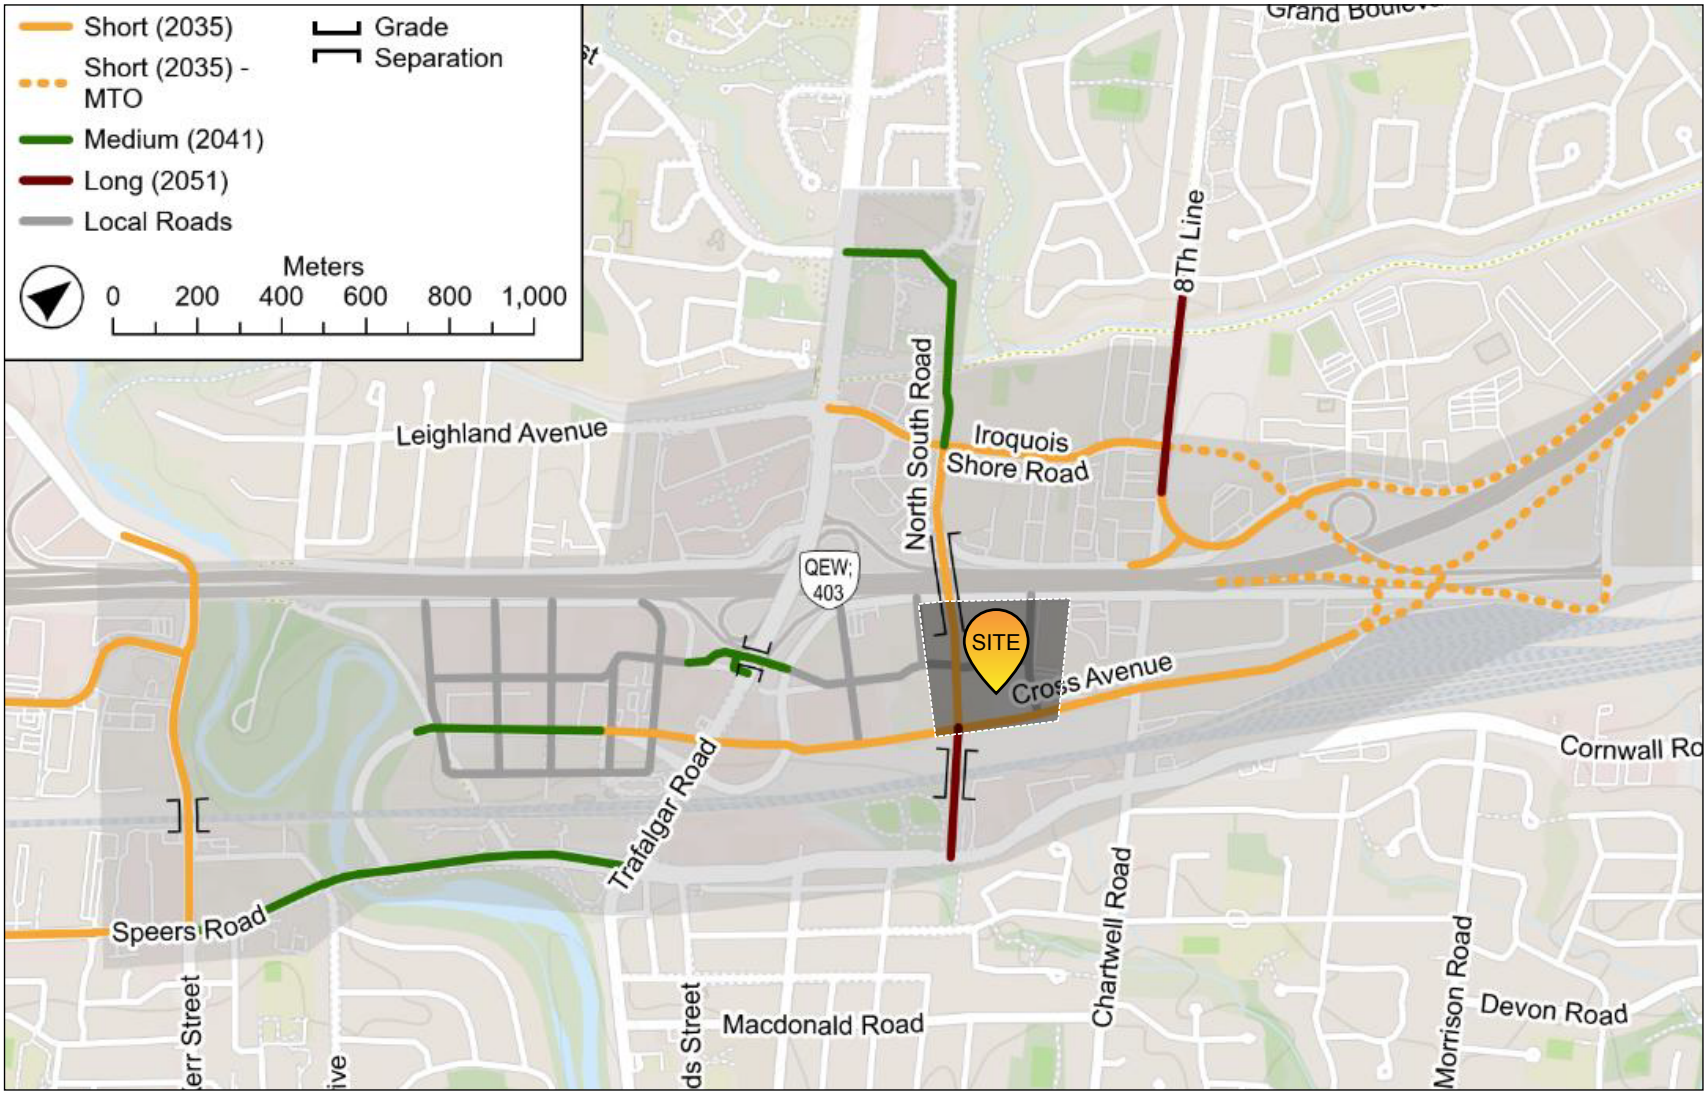


The planned Midtown Oakville street network that was presented in the Midtown Implementation Program PIC Panels in 2025 is illustrated **Figure 9**. The adopted broader street network for this report, inclusive of the Royal Windsor Drive interchange at the QEW, is illustrated in **Figure 10.**

The future lane configurations and traffic control considered for the traffic analysis undertaken for this report, are illustrated in **Figure 13.**

2.2 Additional Key Transportation Figures

To provide the appropriate background information for this updated report, and to assist with the review of the updated traffic analysis, the following additional figures have been included in this section:



- **Figure 11** – Existing Street Network
- **Figure 12** – Existing Lane Configuration and Traffic Control
- **Figure 13** – Future Lane Configuration and Traffic Control
- **Figure 14** – Future Recommended Transit Network (TMP)
- **Figure 15** – Recommended Active transportation Network (Midtown Oakville Schedule L-6)

FIGURE 15 MIDTOWN OAKVILLE OPA PROPOSED ACTIVE TRANSPORTATION NETWORK

3.0 OVERVIEW OF SITE MASTER PLAN

The proposed Site Master Plan includes four blocks with a total of 5,600 residential units and 9,118 m^2 GFA of retail. The development statistics are summarized in **Table 2**.

3.1 New Public Street Network

The proposed new public street network remains the same as the October 2025 application.

The development blocks will be framed by a network of east-west and north-south streets including:

- Street A – A new north-south local street along the western edge of the Site connecting between South Service Road East and Cross Avenue;
- Street B – A new north-south local street along the eastern edge of the Site connecting between South Service Road East and Cross Avenue;
- South Service Road – An existing east-west local road along the north edge of the Site;
- Davis Road – A new east-west collector road through the centre of the Site connecting from west of Trafalgar Road (where it becomes Argus Road) to Street B;
- Cross Avenue – A new east-west arterial road along the south edge of the Site connecting from west of Trafalgar Road to Chartwell Road east of the Site; and
- North-South Arterial – A new north-south arterial road through the centre of the Site connecting from Iroquois Shore Road in the north to Cornwall Road in the south. The North-South Arterial road will have an overpass over the QEW to the north of the Site, and an underpass under the Metrolinx/CN rail corridor to the south of the Site.

A description of the new public streets including a design conformance review is provided in Section **5.0**.

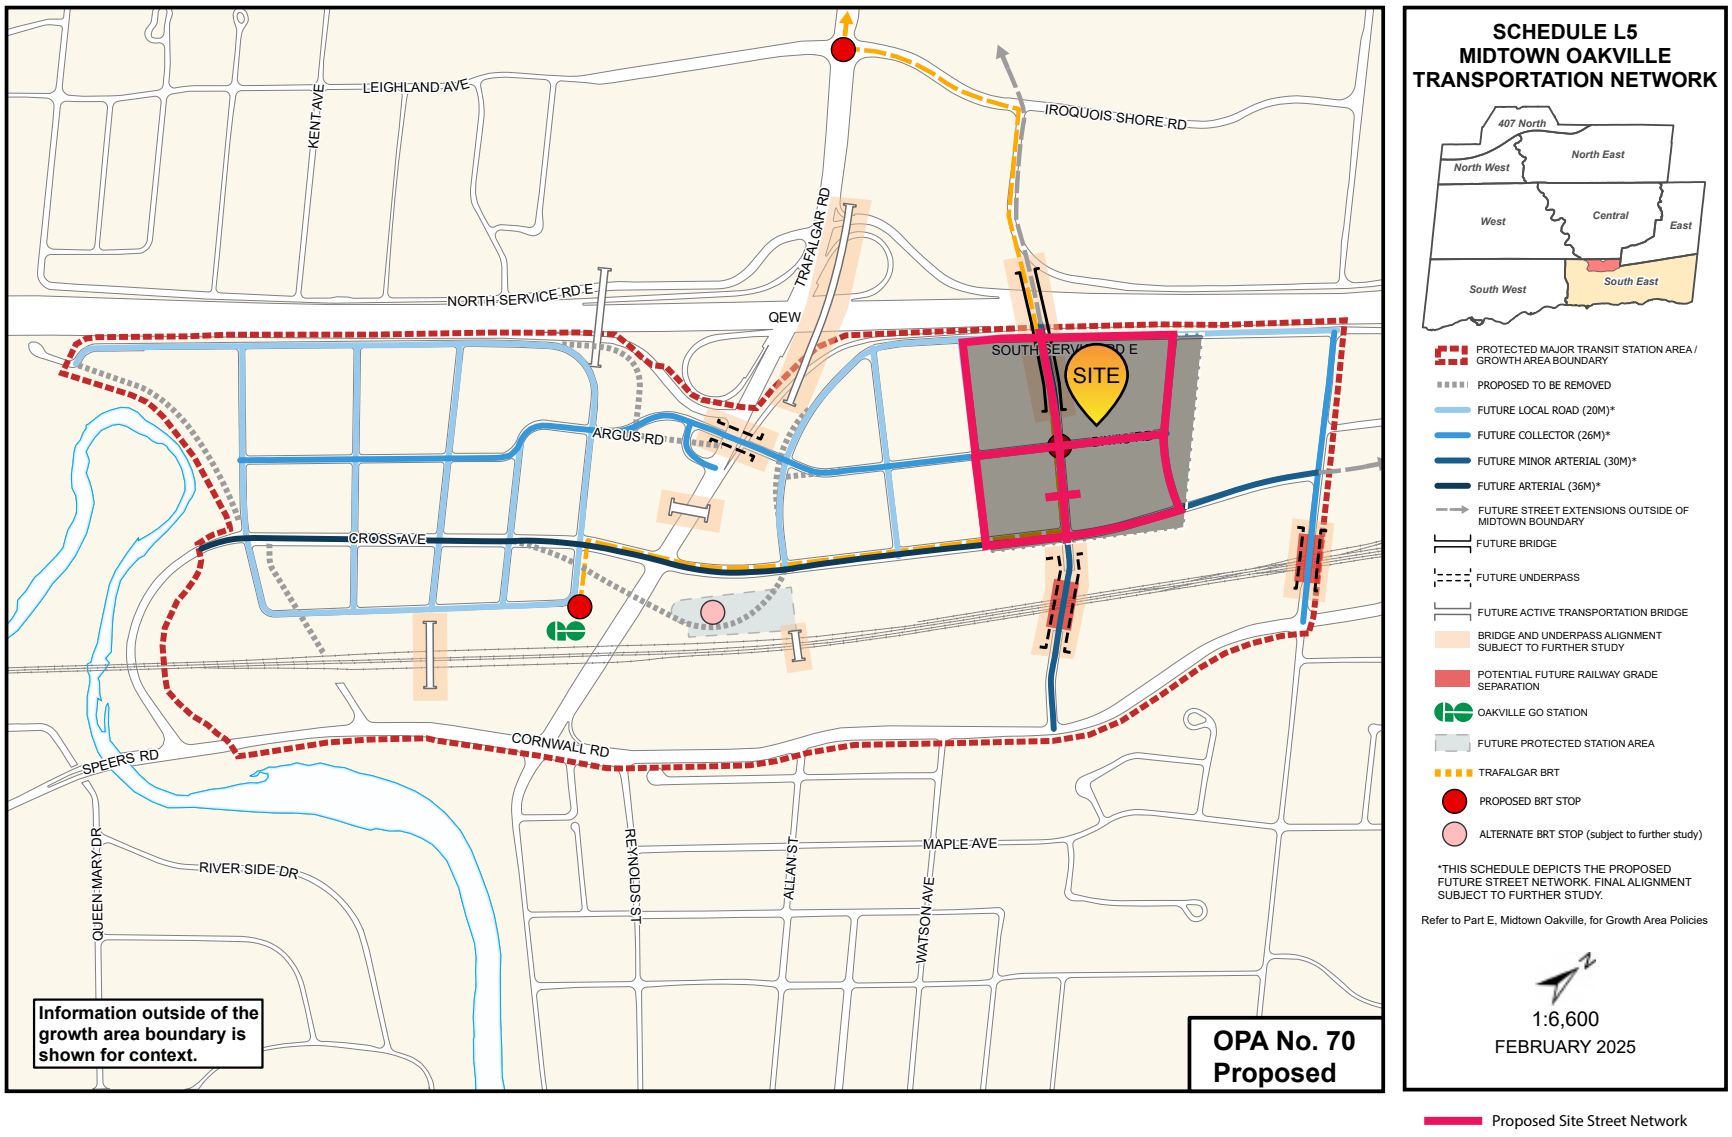
The new public street network will provide access for all modes and generally aligns with the transportation network contained in the Oakville Midtown Official Plan Amendment (the “Midtown OPA”). The proposed street network, with connections to the Draft Midtown Oakville OPA transportation network, is illustrated in **Figure 16.**

To better align with the Site’s western property boundary and to facilitate the efficient development of the blocks, the following minor changes to the Draft Midtown Oakville OPA street network are being proposed:

- The Draft Midtown Oakville OPA illustrates a new north-street local street along the western border of the Site that connects between South Service Road East and Davis Road. The development proposal extends this north-south street (proposed as Local Street A) southward from Davis Road to connect to Cross Avenue. The extension of this local road will provide improved connectivity for all modes of travel and better serve the access and circulation needs of the revised development proposal.
- The north-south local street (Local Street A) on the west side of the Site, is proposed to be shifted slightly further west to align with the western property limits of the Site so that Local Street A is within the Site boundaries.
- The addition of two active-only crossings of the planned New N-S Arterial streetthat bypass the QEW-Hwy 403 and the Metrolinx/CN rail corridor. On the north side of the Site (between South Service Road

East and Davis Road), the active-only crossing will be in the form of an underpass under the New N-S Arterial Street. Between Davis Road and Cross Avenue, the active-only crossing will be in the form of an overpass over the New N-S Arterial Street.

- The east-west Collector Street (Davis Road), adjacent to the proposed Block 1 within the Site, will adopt a tangent alignment versus the “curved” alignment illustrated in the Draft Midtown Oakville OPA. This tangent alignment produces a more uniform development block on the north side of Davis Road, that also provides a more regular shape to maximize the efficient massing of buildings.



The proposed changes enhance the functionality of the Draft Midtown Oakville OPA transportation network. The remainder of the proposed new street network remains consistent with the Draft Midtown Oakville OPA, including the extension of Davis Road, Cross Avenue through the Site and the New N-S Arterial Street that with an overpass across the QEW-Hwy 403 to the north and a “rail-over-road” underpass across the Metrolinx / CN rail corridor to the south

Functional plans for the new public street network are provided in **Appendix D**. Proposed cross-sections for these streets are provided in **Appendix E**.

The functional plans adopt the Draft Midtown Oakville OPA rights-of-ways (ROW’s) and balance travel demand needs, in order to encourage active transportation to serve the day-to-day needs of residents, visitors, employees and commuters.

To enhance the level of safety for active transportation, an option for a protected intersection at Davis Street and the New N-S Arterial Street has been designed and is provided in **Appendix F**.

The vertical profile for the New N-S Arterial Street is provided in **Appendix G.**

/Users/leannedowdall/Library/CloudStorage/GoogleDrive-leannekroll21@gmail.com/MyDrive/BAGroup/6931-03/Graphics_2025/Adobe/IDs/6931-03.indd

FIGURE 16 PROPOSED SITE MASTER PLAN STREET NETWORK

3.2 Vehicle Access

The proposed points of access for the four development blocks remain the same as the October 2025 application and are summarized in **Table 3**.

The Site driveways have been located in consideration of internal circulation systems that accommodate pick-up and drop-off needs, access to loading facilities, emergency access and access to below-grade parking garage ramps.

Table 3 Proposed Points of Access for the Site by Block

	South Service Road	Davis Road	Local Street A	Local Street B
Block 1	1 access	1 access	1 access	--
Block 2	1 access	1 access	--	1 access
Block 3	--	1 access	2 accesses	--
Block 4	--	1 access	--	1 access

The Town of Oakville standards (STD. 10-2) reference a minimum 7.5 metre width for all driveway accesses. All driveway accesses along Davis Road meet this requirement but a 6.0 metre driveway width is proposed for all accesses along the local streets and South Service Road East. A narrower driveway width along lower order roads prioritizes pedestrians by minimizing crossing widths and acts as a traffic calming measure by encouraging lower vehicle speeds. The proposed driveway widths also accommodate all vehicle movements.

The Transportation Association of Canada (TAC) guide only provides suggested clear throat lengths for collector and arterial roads. Therefore, clear throat distances for the Davis Road (minor collector road) driveways are provided on the functional road plan. Since the driveways provide priority to inbound vehicles, the distance is measured from the road to the pick-up / drop-off courtyard. The suggested 25 metre clear throat length is provided for all Davis Road driveways.

An illustration of these measurements is provided in the functional plan in **Appendix D.**

3.3 Pedestrian Access

Pedestrian access and circulation will be provided throughout all four development blocks, with connectivity to the surrounding street network. This ensures direct and convenient access to and from all new public streets that are adjacent to Site, as well as to planned transit routings throughout the Midtown Oakville area, with links to the Oakville GO Transit hub. The development blocks will also include pedestrian linkages throughout for each building within the Site. The retail spaces will be located at-grade, along the frontage of the east-west collector street (Davis Road Extension), through the centre of the mixed-use development. This is consistent with the uses expected along “Primary” and “Secondary” main streets in the Midtown area.

A pedestrian circulation plan for the Site will be provided during the Site Plan Approval (SPA) stage.

3.4 Cycling Access / Circulation

Cycling infrastructure is also planned for the Site, including dedicated bicycle parking rooms for long-term bicycle uses (i.e. resident and employee bike parking), with a mix of internal and external bicycle parking for short-term bicycle uses (i.e., resident visitor and non-residential visitor bicycle parking). The provision of convenient and direct connections between the Site's cycling facilities and infrastructure planned within the new public streets within the Midtown area, will link the Site to the multi-modal transportation network being created throughout Midtown Oakville and the broader Town of Oakville.

A cyclist circulation plan for the Site will be provided during the SPA stage.

3.5 Vehicle Parking

The proposed vehicle parking arrangements remain the same as the October 2025 application. Vehicle parking will be provided within below-grade parking facilities for each residential block. A series of at-grade facilities for pick-up and drop-off and service and emergency vehicle access, will also be provided at-grade to ensure that the Site will be appropriately served and connected to the planned public transportation systems within Midtown Oakville.

Proposed on-street parking locations have been identified on the road network functional plan included in **Appendix D**.

3.6 Bicycle Parking

The proposed bicycle parking arrangements remain the same as the October 2025 application.

The Site plan currently provides a total minimum of 4,180 bicycle parking spaces, including:

- A minimum of 3,473 long-term resident bicycle parking spaces within secure weather-protected facilities located within the underground parking garage, at grade, or on the mezzanine level.
- A minimum of 696 short-term resident visitor bicycle parking spaces will be provided on the Site.
- A further minimum of 11 bicycle parking spaces will be provided in proximity to the non-residential (retail) land uses likely along the development frontage of the E-W Collector street (Davis Road).
- Access to the bike parking rooms will be via pass-card or key and include security features.
- Access to long-term bike parking will generally be provided with dedicated elevators so as not to conflict with main pedestrian elevators.
- The bicycle repair stations will generally be provided within the bicycle storage rooms. The number and precise location of the bicycle repair stations will depend on the configuration and number of the internal bicycle storage rooms.
- Short-term bicycle parking will generally be included outside and near visitor / customer entrances so as to be convenient. Some residential visitor bicycle parking will likely be located internal to the residential buildings, given the proposed supply of visitor bike parking.
- Access to visitor internal bicycle parking storage areas will be coordinated with the architectural layout of the residential buildings and their podiums with the provision of access to external entrances.

3.7 Pick-up / Drop-off Facilities

3.7.1 Pick-up/ Drop-off Courtyards

Pick-up / drop-off (PUDO) facilities are proposed for each block to accommodate pick-up /drop-off and delivery activities for all buildings on the Site.

The location and configuration of the PUDO facilities remain the same as the October 2025 application. However at the request of Oakville Transit, the dimensions of the PUDO facilities have been increased to be 21m x 21m (from 20m x 20m) to accommodate the manoeuvring requirements of Oakville Transit Care-A-Van vehicles. The PUDO facilities are appropriately sized and located in consideration of convenient front door access. The PUDO facilities for each block will be further refined through subsequent phases of the development process.

3.8 Loading

The location and configuration of the loading facilities remain the same as the October 2025 application.

Each building or group of buildings on the development blocks has been evaluated in regard to the practical, functional and policy requirements associated with the various types of loading operations that would be experienced on a daily basis.

The functional design of the proposed loading areas has been assessed with appropriate design vehicles and manoeuvring requirements, to ensure that the resulting loading spaces are capable of accommodating the needs each individual development building and or block. This ensures an efficient and compact development and safe Master Plan concept.

A total of 19 formal loading spaces that meet the Town of Oakville's dimensional requirements have been provided across the four development blocks of the Site.

The loading facilities for each building, including the design of vehicle manoeuvring areas, will be refined during the SPA stage.

3.9 Vehicle Ramp Design Considerations

Proposed parking ramp locations remain the same as the October 2025 application.

Blocks 1 and 2 are each envisioned to include two ramps to service their respective block and will only accommodate typical passenger vehicles. Blocks 3 and 4 are also envisioned to each include two ramps but one of the ramps will also accommodate loading vehicles. A loading area is proposed on the P3 level for both Blocks 3 and 4 to service the non-residential uses that front Cross Avenue.

At this time, the grading for each of these ramps has not been finalized but they will be refined as the development application process continues. It is intended to design the passenger vehicle ramps with a maximum slope of 15%, with 7.5% sloped transitions located at the top and bottom of each ramp. This design ensures a gradual vertical change and mitigates the vehicle chassis from striking the ground.

The design of parking facilities including ramp access, layout and circulation will be refined during the SPA stage.

3.10 Traffic Management During Construction

The current application is for a Draft Plan of Subdivision. It is premature at this time to assess and prepare a set of plans that would outline and detail a strategy for the phased construction of the individual blocks within the Site. For this reason, a Construction Management Plan (CMP) strategy and supporting Traffic Management During Construction (TMDC) Plan will be undertaken at a later stage of the development application process.

4.0 DEVELOPMENT PHASING

The preliminary phasing of the development blocks is summarized in **Table 4**. The current conceptual phasing plan is illustrated in **Appendix H.**

The phasing will be re-evaluated after the completion of Phase 1. This approach allows reasonable assumptions to be made in regard to the proposed street network for all phases, while maintaining flexibility for adjustments in the future stages of development for the Site.

Table 4 Preliminary Development Phasing

Block	Phase	Proposed Building	Proposed Street Network
1	Phase 1a	Tower A1, Midrise A2	Local Street A (South Service Road East to Davis Road) with a Site driveway on Local Street A.
	Phase 1b	Tower B1, Tower C1, Townhouses C2 Tower D1, Midrise D2	Above plus: • Site driveway on South Service Road East • Site driveway on Davis Road (Local Street A to New N-S Arterial Street).
2 to 4	--	After completion of Block 1, the order of build-out of the subsequent blocks is to be based on market demand.	The need for new internal road linkages as well as wider area transportation and servicing infrastructure to support each block will be re-evaluated in conjunction with that block.

5.0 ROAD DESIGN CONFORMANCE REVIEW

As per the Town's request, this section is intended to review the proposed road design elements against the Town standards and, where applicable, TAC guidelines or industry best practices, with the intent that any identified non-conformance (e.g., daylight triangles) would be supported by appropriate transportation engineering justification.

5.1 Proposed Public Street Network

The proposed road network for the Site aligns with the road rights-of-ways (ROW) and alignments outlined in the Midtown TMP, OPA 70 and Designing Midtown. However, alternative cross-sections have been developed for the proposed roads, that in BA Group's opinion, better accommodate pedestrian and cyclist comfort and safety.

A comparison of the proposed cross-sections for the Site, and the proposed draft Midtown Oakville cross-sections, is provided in **Table 5.** Illustrations of the proposed cross sections are provided in **Appendix E**. An illustration of the proposed road cross-sections vs. TMP road cross-sections is provided in **Figure 17**.

5.1.1 Local Roads

Within the development lands, Street A, Street B and South Service Road East, are all considered to be local roads with a 20 m ROW, which aligns with the widths outlined in OPA 70. Draft cross sections for local roads within Midtown Oakville were presented in Appendix F of the Town's October 2024 staff report, which contemplates the following three potential layouts related to cycling infrastructure:

1. A shared on-street condition with bicycles and vehicles (sharrows);
2. Dedicated one-way cycle track (within the boulevard) on both sides of the road; and
3. Dedicated two-way cycle track (within the boulevard) on one side of the road.

The Site's proposed cross-section for the local roads closely aligns with the first option, with the shared on-street condition. However, it is currently proposed to include on-street parking on only one side of the road, adjacent to the Site. The posted and design speed for these roads are 40 km/h and 50 km/h, respectively.

5.1.2 Davis Road

Davis Road is proposed to be a collector road and have a 26 m ROW width which aligns with OPA 70. In comparison to the cross-section figures from the Town's June 2025 Open House, the Site's proposed design of Davis Road enhances the pedestrian and cyclist levels of comfort and safety of the envisioned high street. Bicycle lanes are relocated from the street onto the boulevard and a wider sidewalk on both sides of the road is proposed. A buffer will be provided between the different modes of travel along the road. The posted and design speed for Davis Road are 40 km/h and 50 km/h, respectively.

5.1.3 N-S Arterial Road

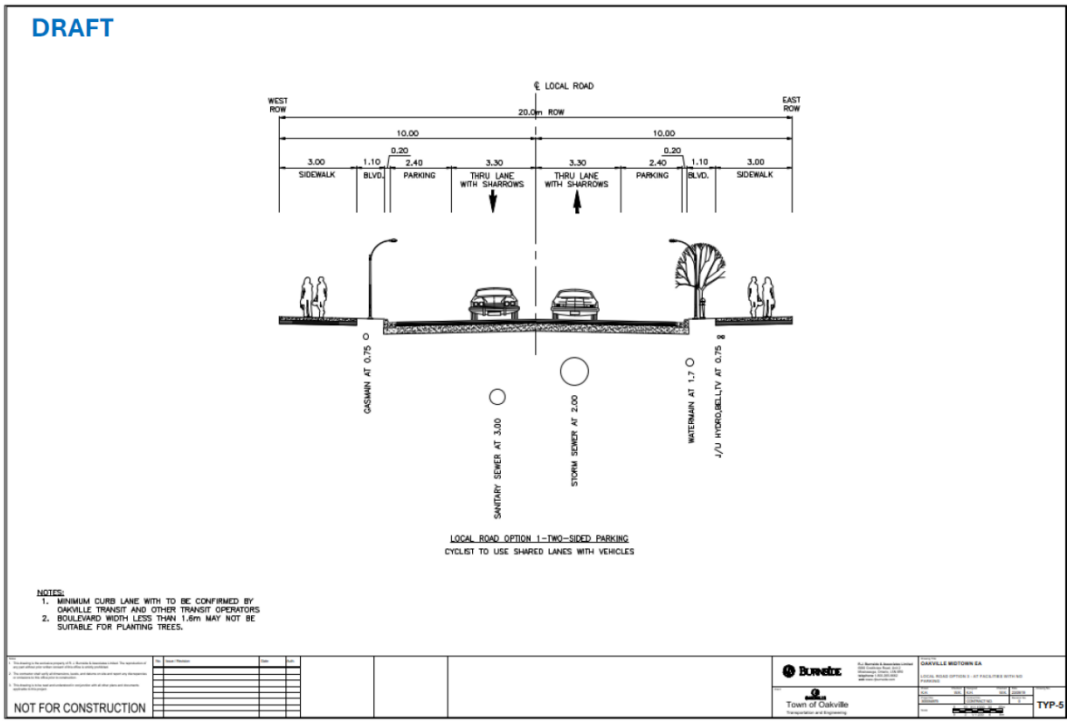
A 30 m ROW is proposed for the N-S Arterial Road which aligns with OPA 70. Although the draft cross-section for the N-S Arterial Road within the Town's October 2024 staff report indicates a 26m ROW (which is considered outdated), its cross-section elements are similar to what is being proposed for the Site. The 4m ROW difference in the proposed cross-section is attributed to a centre median that separates the directional flows of traffic. The posted and design speed for the N-S Arterial Road are 50 km/h and 60 km/h, respectively.

5.1.4 Cross Avenue

Cross Avenue is proposed to be an arterial road, and its ROW width varies as it crosses the N-S Arterial Road. East of the N-S Arterial Road, the Site proposes a 30 m ROW and west of the N-S Arterial Road a 36 m ROW is proposed. The proposed ROW widths along Cross Avenue align with OPA 70 and the proposed cross-section elements are similar to available draft Midtown Oakville cross-sections. It should be noted that the October 2024 staff report's draft cross-section for Cross Avenue on the east side of the N-S Arterial Road indicates a 26m ROW which is considered outdated. The posted and design speed for Cross Avenue are 50 km/h and 60 km/h, respectively.

Table 5 Comparison of Road Cross-Section Elements

Road Elements	Preliminary Cross-Section for Midtown Oakville	Proposed Cross-Section
Street A/ Street B / South Service Road East		
ROW Width	20.00 m[1]	20.00 m
Lane Width	3.30 m[1]	3.25 m
On-Street Parking Width	2.40 m[1]	2.00 m
Sidewalk Width	Ranges from 2.4m to 3.00 m depending on cross section option[1]	2.00 m
Cycle Track Width	Shared Bike Lane On-street (Sharrow) [1] 1.80 m for a one-way cycle track within boulevard[1] 3.50 m for a two-way cycle track within boulevard[1]	Shared Bike Lane On-street (Sharrow)
Landscape Width	Ranges from 1.00 m to 1.10 m[1]	2.75 m
Davis Road		
ROW Width	26.00 m[2]	26.00 m
Lane Width	3.00 m[2]	3.50 m
On-Street Parking Width	2.40 m lay-by parking[2]	2.40 m lay-by parking
Sidewalk Width	2.90 m[2]	3.15 m on the south side of Davis Road 4.15 m on the north side of Davis Road
Cycle Track Width	1.50 m one-way cycle track on-street[2]	1.50 one-way cycle track within boulevard
Landscape Width	Ranges from 2.20 m to 4.60 m depending on lay-by parking locations[2]	Ranges from 1.10 m to 3.50 m depending on lay-by parking locations
N-S Arterial Road		
ROW Width	26.00 m[3] NOTE: The previously published 26m cross-section from the October 2024 Midtown Oakville staff report is	30.0 m



Road Elements	Preliminary Cross-Section for Midtown Oakville	Proposed Cross-Section
	outdated, as OPA 70 adopted a wider 30m ROW for this section. Updated Town cross-sections are not yet available.	
Lane Width	3.00 m inner lane[3] 3.50 m curb lane[3]	3.00 m inner lane 3.50 m curb lane
On-Street Parking Width	N/A[3]	N/A
Sidewalk Width	2.40 m[3]	2.70 m
Cycle Track Width	2.00 m one-way cycle track within boulevard[3]	2.00 m one-way cycle track within boulevard
Landscape Width	1.30 m[3]	N/A
Cross Avenue – East of N-S Arterial Road		
ROW Width	26.00 m[4] NOTE: The previously published 26m cross-section from the October 2024 Midtown Oakville staff report is outdated, as OPA 70 adopted a wider 30m ROW for this section. Updated Town cross-sections are not yet available for the section of Cross Avenue east of the N-S Arterial.	30.00m
Lane Width	3.00 m inner lane[4] 3.30 m curb lane[4]	3.30 m inner lane 3.50 m curb lane
On-Street Parking Width	N/A[4]	N/A
Sidewalk Width	2.40 m[4]	2.45 m
Cycle Track Width	2.00 m one-way cycle track within boulevard[4]	2.00 m one-way cycle track within boulevard
Landscape Width	1.50 m[4]	2.25 m
Cross Avenue – West of N-S Arterial Road		
ROW Width	36.00 m[5]	36.00m
Lane Width	3.00 m inner lane[5]	3.30 m inner lane

Road Elements	Preliminary Cross-Section for Midtown Oakville	Proposed Cross-Section
	3.50 m curb lane[5]	3.50 m curb lane
On-Street Parking Width	N/A[5]	N/A
Sidewalk Width	3.50 m[5]	2.95 m
Cycle Track Width	2.00 m one-way cycle track within boulevard[5]	2.00 m one-way cycle track within boulevard
Landscape Width	3.00 m[5]	2.25 m

Notes:

5.2 Intersection Design Review

A geometric review of the proposed public road intersections was reviewed against the Town's standards and TAC Guide based upon the following elements:

- Intersection Radius
- Intersection Angle; and,
- Intersection Spacing

A road design conformance review is provided in **Appendix I**.

Table 6 Intersection Review

Intersection	Intersection Control	Intersection Radius	Intersection Angle	Intersection Spacing
TAC Guideline	**--**	**Refers to Town standards**	**Between 70° and 90°**	**60 m for local roads** **60 m for collector roads** **200m for arterial roads**
Town Standard	**--**	**7.5 m for local roads** **10.0 m for collector roads** **10.5m for arterial roads**	**N/A**	**N/A**
Street A / South Service Road East	One-way stop control	10.0 m	95°	160.0 metres to Street A / Davis Road 360.0 m to Street B / South Service Road East
Street A / Davis Road	Two-way stop control	10.0 m	90°	165.0 metres to Street A / South Service Road East 105.0 metres to Street A / Cross Avenue 145.0 metres to N-S Arterial Road / Davis Road
Street A / Cross Avenue	One-way stop control	10.5 m	90°	105.0 metres to Street A / Davis Road 140.0 metres to N-S Arterial Road / Davis Road
N-S Arterial Road / Davis Road	Signalized	15.0 m	92°	150.0 metres to Street A / Davis Road

Intersection	Intersection Control	Intersection Radius	Intersection Angle	Intersection Spacing
				135.0 metres to Street B / Davis Road 105.0 metres to N-S Arterial Road / Cross Avenue
N-S Arterial Road / Cross Avenue	Signalized	15.0 m	92°	140.0 metres to Street A / Cross Avenue 145.0 metres to Street B / Cross Avenue 95.0 metres to N-S Arterial Road / Davis Road
Street B / South Service Road East	One-way stop control	10.0 metres	97°	130.0 metres to Street B / Davis Road 360.0 m to Street A / South Service Road East
Street B / Davis Road	One-way stop control	10.0 metres	97°	130.0 metres to Street B / South Service Road East 90.0 metres to Street B / Cross Avenue 125.0 metres to N-S Arterial Road / Davis Road
Street B / Cross Avenue	One-way stop control	10.5 metres	90°	90.0 metres to Street B / Davis Road 145.0 metres to N-S Arterial Road / Davis Road

The proposed intersections meet all the requirements outlined in Town's standards and the TAC Guide apart from the intersection spacing along the proposed arterial roads (Cross Avenue and N-S Arterial Road). These non-compliant intersections are unable to achieve the suggested 200 m intersection spacing outlined in the TAC Guide but are considered acceptable for the following reasons:

Cross Avenue

- The road alignment of Cross Avenue aligns with the proposed road network outlined in OPA 70.

- As indicated by the anticipated queue lengths in **Section 13.0**, the forecasted vehicle queuing can be accommodated within the available storage despite having shorter spacing.
- The intersections of Cross Avenue / Street A and Cross Avenue / Street B are proposed to operate as one-sided stop control. Queuing will only occur on the local streets and will not affect the operations along the arterial road.

N-S Arterial Road

- The road alignment of the N-S Arterial Road also aligns with the proposed road network outlined in OPA 70.
- As indicated by the anticipated queue lengths in **Section 13.0**, the forecasted vehicle queuing can be accommodated within the available storage area along the N-S Arterial Road between the Davis Road and Cross Avenue intersections.

5.3 Horizontal Curvature and Centreline Radius Assessment

There are three locations within the proposed road network that are curved. They are located on Street B, N-S Arterial Road, and Cross Avenue. The proposed centreline radii and the Town's requirements are summarized in **Table 7** and annotated within the road design conformance review provided in **Appendix I**.

Table 7 Centreline Radius Review

Street	Road Classification	Design Speed	Town of Oakville Minimum Centerline Radius[1]	TAC Recommended Minimum Centerline Radius[2]	Proposed Centerline Radius
Street B	Local Road	50 km/h	90.0 m	110.0 m	250.0 m
N-S Arterial Road	Minor Arterial Road	60 km/h	130.0 m to 250.0 m	177.0 m	230.0 m
Cross Avenue (east of N-S Arterial Road)	Minor Arterial Road	60 km/h	130.0 m to 250.0 m	177.0 m	250.0 m

Notes:
1. Town of Oakville Road Geometric Design Standards Drawing STD 8-4
2. TAC Geometric Design Guide for Canadian Roads, June 2017, Figure 3.2.4. Normal Crown in a Low-Speed Urban Environment

The design of the proposed centreline radii meets all applicable Town of Oakville design parameters and TAC Guidelines.

5.4 Vertical Curvature Assessment

The vertical profile for the New N-S Arterial Street is provided in **Appendix G.**

5.5 Tangent Length Assessment

The proposed road network is generally straight as indicated by the intersection angles presented in **Table 6**. The tangent lengths for the proposed intersections were reviewed against both the Town's standards and the TAC Guide in **Table 8**.

Table 8 Tangent Length Review

Intersection	Road Classification	Intersection Control	Town of Oakville Minimum Tangent Length[1]	TAC Recommended Tangent Length[2]	Proposed Tangent Length
Street A / South Service Road East	Local Road / Local Road	One-way stop control on Street A	30.0 m for both roads	20.0 m	>30.0 m for both roads
Street A / Davis Road	Local Road / Collector Road	Two-way stop control on Street A	30.0 m for both roads	20.0 m	>30.0 m for both roads
Street A / Cross Avenue	Local Road / Arterial Road	One-way stop control on Street A	30.0 m for local road 60.0 m for arterial road	20.0 m	>30.0 m for local road >60.0 m for arterial road
N-S Arterial Road / Davis Road	Minor Arterial Road / Collector Road	Signalized	30.0 m for collector road 60.0 m for arterial road	20.0 m	>30.0 m for collector road 52.0 m for arterial road
N-S Arterial Road / Cross Avenue	Minor Arterial Road / Arterial Road	Signalized	60.0 m for both roads	20.0 m	>60.0 m for N-S Arterial Road 20.0 m for Cross Avenue
Street B / South Service Road East	Local Road / Local Road	One-way stop control on Street B	30.0 m for both roads	20.0 m	>30.0 m for both roads
Street B / Davis Road	Local Road / Collector Road	One-way stop control on Davis Road	30.0 m for both roads	20.0 m	>30.0 m for Davis road Street B curves through intersection
Street B / Cross Avenue	Local Road / Arterial Road	One-way stop control on Street B	30.0 m for local road 60.0 m for arterial road	20.0 m	>30.0 m for both roads

Notes:
1. Town of Oakville Road Geometric Design Standards Drawing STD 8-4
2. TAC Geometric Design Guide for Canadian Roads, June 2017, Section 9.7.2

Three of the proposed intersections do not meet the tangent length requirements outlined either in the Town's standards or the TAC Guide but are considered acceptable for the following reasons:

N-S Arterial Road / Davis Road

- The 52.0 m tangent length along the north side of the N-S Arterial Road is a result of the large 250.0 m centreline radius that exceeds the Town of Oakville's requirements and the TAC guidelines.
- The intersection is signal controlled and there are no sight distance limitations

N-S Arterial Road / Cross Avenue

- The 20.0 m tangent length along the east side of Cross Avenue is a result of the large 250.0 m centreline radius that exceeds the Town of Oakville's requirements and the TAC guidelines.
- The intersection is signal controlled and there are no sight distance limitations

Street B / Davis Road

- The intersection is stop controlled along Davis Road and a sight distance review concluded that there are no sight distance limitations at this intersection. The sight distance review is discussed further in **Section 5.8**.

The substandard tangents are annotated within the road design conformance review provided in **Appendix I**.

5.6 Driveway Spacing Assessment

The driveway spacings of the site driveways were reviewed against the TAC Guidelines as there are no minimum requirements outlined in the Town of Oakville road standards. Drawing STD 10-2 outlines minimum driveway spacings for non-residential uses only.

The proposed driveway spacing and the TAC guide's recommended driveway spacing are compared in **Table 9**. The annotation of the driveway spacing is provided within the road design conformance review in **Appendix I**.

Table 9 Driveway Spacing Review

Street	TAC Recommended Minimum Driveway Spacing [1]	Proposed Driveway Spacing
Private Driveway #1	3.0 m	30.0 m
Private Driveway #2	3.0 m	65.0 m
Private Driveway #3	3.0 m	30.0 m
Private Driveway #4	3.0 m	45.0 m
Private Driveway #5	3.0 m	45.0 m
Private Driveway #6	3.0 m	45.0 m
Private Driveway #7	3.0 m	45.0 m
Private Driveway #8	3.0 m	40.0 m
Private Driveway #9	3.0 m	40.0 m
Private Driveway #10	3.0 m	20.0 m

Notes:
1. TAC Geometric Design Guide for Canadian Roads, June 2017, Figure 8.9.2

All proposed driveways meet the suggested dimensions in the TAC Guide for the spacing length.

5.7 Vehicle Turning Review

The vehicle manoeuvring diagrams (VMD's) for the proposed intersections are provided in **Appendix J.** These VMD's include consideration for a Halton Region waste collection vehicle (10.5 m length) and a TAC single-unit truck (9.1 m length) to confirm the functionality of the intersection design of the proposed road plan.

5.8 Sight Distance Assessments

Sight distance assessments have been undertaken at intersections where there is 2-way stop control. It is noted that for intersections where signalization or all-way stop control is proposed, sight distance analysis is not required and has therefore not been undertaken.

The sight distance assessments have been provided in **Appendix K** and indicate that the minimum sight distance requirements are met at each of the intersections.

5.9 Daylighting Triangles

Daylighting triangles are located at the corners of an intersection and are typically kept free of visual obstacles that could restrict a driver's sightline. The purposes of daylighting triangles are as follows:

1. Provide sight distance;
2. Minimize conflicts between pedestrian, cyclists and vehicles;
3. Provide space for utilities, streetscape and street furniture; and
4. Widen sidewalks at the corners of intersections.

The size of a daylighting triangle is dependent on the road classification of the intersecting public roads and the type of intersection control.

As part of the development of the Site, daylighting is being provided at arterial intersections, while corner roundings are being provided at local / collector intersections. Full daylighting is being proposed at traffic signals.

The Town's daylighting requirements, as per the Oakville standard STD 8-4 (last revised in July 1995), are summarized in **Table 10**.

Table 10 Town of Oakville Daylighting Triangle Requirements

Road Classification	Daylighting triangles			
	Minor Local Road	Local Road	Collector Road	Arterial Road
Minor Local / Local Road	n/a	n/a	7.5 m	15.0 m
Collector Road	7.5 m	7.5 m	7.5 m	15.0 m
Arterial Road	15.0 m	15.0 m	15.0 m	15.0 m

The Oakville OP policy: 8.12.3 states the following:

> "*Where appropriate and public safety is not affected, the Town will minimize the amount of land utilized for daylighting triangles to contribute to a more urban environment and maximize the efficient use of land.*"

Consistent with Oakville OP policy 8.12.3, and to ensure a more urban context is created at intersections within Midtown, reduced daylighting triangles and corner roundings are proposed at the intersections of the local, collector and arterial streets.

A summary of the daylighting triangles and corner roundings proposed for the public street intersections is provided in **Table 11.** These daylighting and corner rounds are appropriate within an urban environment, such as what is being proposed for the Site. These areas are also proposed to be provided for surface easements, which allows for the garage to extend below these areas resulting in compact and efficient below-grade parking facilities.

Table 11 Proposed Midtown Oakville Daylighting Triangle and Corner Roundings

Road Classification	Minor Local Road	Local Road	Collector Road	Arterial Road
Minor Local / Local Road	5.0 m corner rounding	5 m corner rounding	7.5 m corner rounding	7.5 m daylighting triangle
Collector Road	7.5 m corner rounding	7.5 m corner rounding	7.5 m corner rounding	7.5 m daylighting triangle
Arterial Road	7.5 m daylighting triangle	7.5 m daylighting triangle	7.5 m daylighting triangle	7.5 m daylighting triangle

As a comparison, the City of Toronto adopts corner roundings at intersections based upon the road ROW widths, as summarized in **Table 12.** The City of Toronto corner rounding requirements have been referenced to provide a comparable guideline for the urban community being envisioned within the Midtown Oakville area.

It is noted that the City of Toronto permits development sites to adopt these corner roundings to function as surface easements to facilitate the construction of below-grade parking facilities. With the proposed corner roundings being kept clear of visual obstructions, the below-grade facilities will not influence the at-grade sightlines or create conflicts between pedestrians and vehicles. An efficient below-grade structure can be erected right up to the property lines.

Table 12 City of Toronto Corner Rounding Requirements

Intersection Approaches		ROW Rounding
ROW Width (m)	Intersecting With ROW Width (m)	
<23	<23	5.0 m
23-36	23-36	6.0 m
<36	<36	8.0 m

6.0 VEHICLE PARKING

6.1 Site-Specific Zoning Bylaw 2026-074

On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-074 which introduced the following vehicle parking requirements for the Site:

- No minimum requirements for all uses;
- Residents – Maximum of 1.0 space / unit;
- Residential visitors – Maximum of 0.2 spaces / unit;
- Non-residential uses – Maximum of 1.0 space / 25.0sm NFA;
- Business office and medical office uses – Maximum of 1.0 / 28.0sm NFA; and
- Elementary and secondary schools – Maximum of 1.5 spaces / classroom.

6.2 Proposed Vehicle Parking Supply

Notwithstanding the requirements of the Zoning bylaw, a practical parking demand exists that will need to be accommodated for the Site.

The current vehicle parking rates to be adopted for the Site are as follows:

- Resident parking: minimum of 0.50 spaces per unit
- Resident visitor parking: minimum of 0.15 spaces per unit
- Non-resident (retail) parking: minimum of 1.08 spaces per 100 m^2 of GFA

The parking supply for each building will be refined and determined at the SPA stage and will fall within the maximum requirements of the Zoning bylaw.

7.0 BICYCLE PARKING

On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-074 which introduced the following bicycle parking requirements for the Site:

- Residential uses – 0.5 spaces / unit, including 0.1 spaces / unit for visitors; and
- Non-residential uses – 0.35 spaces / 100sm NFA, including 0.25 spaces / 100sm NFA for visitors.

The bicycle parking supply for each building will be refined and determined at the SPA stage and will meet the minimum requirements of the zoning bylaw.

8.0 LOADING

8.1 Loading Requirements

The Town of Oakville's Zoning By-law 2014-014 does not include a requirement for a minimum number of loading spaces. The bylaw does however require the following in regard to where a loading space is provided:

- The minimum dimensions of a loading space are: 3.5 m width, 12.0 m length and 4.2 m vertical clearance;
- A loading space shall abut the building for which the loading space is provided; and
- A loading space shall be set back 7.5 m from any residential zone, except if entirely within a structure.

8.2 Proposed Waste Management Strategy

Regardless of the absence of a zoning bylaw requirement, there is a practical requirement for an appropriate loading supply for the Site that reflects the intensification being proposed. As such, the loading supply has been considered within the context of the following principles:

- Residential refuse loading areas that meet the Region of Halton requirements for dimensional standards (non-residential refuse collection will be privately operated);
- Resident move-in / move-out needs that are impacted by the scale of the scale development and the mix of non-residential uses;
- Delivery vehicle needs associated with the residential units; and
- The needs of the non-residential land uses and their associated intensities.

The Region of Halton has specific vertical clearances for their refuse collection vehicles. A 7.5 m vertical height will be provided where the refuse collection vehicle will be engaged in collecting and returning the bins to their staging area. Beyond this active loading space, a 4.5 m vertical clearance will be provided to ensure that all service vehicle design vehicles are able to enter and exit the loading area without risk of coming into conflict with overhead features of the building (i.e., structural beams, electrical conduits, plumbing pipes, overhead doors, etc.).

8.3 Proposed Loading Supply

The proposed loading arrangements remain the same as the October 2025 application and is summarized in **Table 13.** The loading supply indicates that some of the Type G loading spaces will be shared between some of the towers.

Table 13 Proposed Loading Supply

Block	Number of Towers on Block	Number of 13 m x 4 m (Type G) Loading Spaces	Number of 3.5 m x 11 m (Type B) Loading Spaces	Total Number of Loading Spaces
Block 1	4	3	2	**5**
Block 2	4	3	2	**5**
Block 3	3	2	3	**5**
Block 4	3	2	2	**4**
Total Site	**14**	**10**	**9**	**19**

The Site is proposed to include a total of 19 loading spaces, including 10 Type G spaces (13 metres by 4 metres) and 9 Type B spaces (3.5 metres by 11 metres).

The Type G loading spaces will accommodate refuse collection vehicles, in addition to the space required around the vehicle, related to the collection of refuse bins that are typically collected by an overhead refuse collection vehicle. Additional bin-staging areas will be provided that will be directly related to the scale (number of units) of the residential development to be served by the Type G loading area. For some blocks, in order to be efficient, the Type G loading spaces can serve more than one building.

The loading facilities for each building, including the design of vehicle manoeuvring areas, will be refined during the SPA stage. The loading supply strategy will be evaluated against the practical, functional, and policy requirements associated with the various types of loading operations that would be experienced on a daily basis.

9.0 TRANSPORTATION DEMAND MANAGEMENT (TDM) PLAN

Transportation Demand Management (TDM) measures will be incorporated within the Site to minimize the need for automobile travel and to encourage and facilitate the use of non-automobile travel modes on a daily basis. The following sections outline the proposed physical and operational strategies that complement the Site design, with the goal of encouraging a shift in the travel pattern of future residents to sustainable modes of transportation, while being flexible to adapt to future mobility needs and a long-term phased development plan.

The TDM Plan strives to reduce automobile use as a part of the design and construction of the development, as well as after construction, as an on-going strategy by supporting and promoting the use of non-auto travel modes. The key objective of the TDM Plan is to reduce peak hour single occupant automobile traffic with a focus on the following specific policy areas:

1. Encourage the use of alternative travel modes (transit, cycling and walking);
2. Increase vehicle occupancy;
3. Shift travel to off-peak periods; and
4. Reduce vehicle kilometres travelled.

9.1 TDM Plan Strategies

The existing and future area context provides for excellent public transit services, as well as travel by active transportation, which will reduce the need of future residents of the Site to travel using an automobile. Additional TDM strategies, which have been recommended as part of the proposed development, are summarized in **Table 14**.

Based upon the Site context and proposed land use, the recommended TDM strategies have been selected to further support non-automobile modes of travel. The measures fall into two general categories: a ‘hard’ or ‘soft’ measure. A ‘hard’ TDM measure is a physical infrastructure component, where the applicant is responsible for implementations. A ‘soft’ TDM measure is where the applicant is responsible for notifying a third party for implementations. The following sections provide additional details regarding each recommended TDM strategy.

Table 14 Summary of Potential Site TDM Measures

Measure	Type	Description	Objective
Reduced Car Ownership			
Reduced Parking Supply	Hard Measure	A reduced parking supply is proposed for the Site, in comparison with the minimum resident parking requirements outlined in Town Zoning By-law as follows: • resident parking ratio = 0.50 space per unit; • visitor parking ratio = 0.15 spaces per unit; and, • non-residential parking ratio = 1.08 spaces per 100m^2 GFA Providing a reduced parking supply is a key component in reducing single occupant vehicle trips.	Reduce auto-oriented dependence and the need for everyday travel. Promote non-auto modes of travel during peak travel periods.
Unbundled Parking	Soft Measure	Unbundle unit leases and parking payment.	Reduce auto-oriented dependence and the need for everyday travel.
Car Share Spaces	Hard Measure	Consideration to provide car share spaces on the Site through a car share provider. The number and details of the car shares spaces would be negotiated with a car share provider at a later time.	Promote alternative transportation service options besides car ownership.
Car Share Memberships	Soft Measure	Consideration to provide an optional annual car share membership per unit for the first year of occupancy.	
Parking Pricing	Soft Measure	Consider a paid parking operation for all non-resident parking, provided in a shared parking environment.	Influence travel mode choice.
Cycling			
Bicycle Parking	Hard Measure	Provide bicycle parking that meets or exceeds the zoning bylaw requirements.	Make cycling an attractive option for travel during the peak travel periods.
Bicycle Repair Station	Hard Measure	Provide bicycle repair stations (one for each internal bike storage room) within the residential bicycle parking storage area on Site.	
Bicycle Parking: Range of Types	Hard Measure	Consider providing a range of bicycle parking facilities for long term resident needs, such as cargo bike parking.	Increase the utility of bicycle travel for a variety of trip types.
Bike Share	Hard Measure	Consider providing private bike share stations, both regular and e-bike support, for residents and visitors of the Site.	Promote alternative transportation service options besides car ownership
Micromobility			

Measure	Type	Description	Objective
Private / Shared Micromobility Devices	Hard Measure	Explore the provision of micromobility devices (manual bikes, e-bikes, e-scooters, etc.) in consideration of the Town of Oakville policy review of micromobility to facilitate "last kilometer" trip making in the Midtown Oakville context.	Promote alternative transportation service options besides car ownership
Transit			
Transit Information Centre	Hard Measure	Explore the provision of monitors displaying real-time transit information in the resident lobbies to assist residents taking local transit services (e.g., bus and streetcar routes) and using the GO Transit system.	Reduce car dependence and the need for everyday travel.
Travel Mode Information Package	Soft Measure	Implement marketing programs to ensure that new residents are aware of available modal choices in the area.	Promote transit travel during peak travel periods
Pedestrian Access and Walkability			
Pedestrian & Cycling Connections	Hard Measure	Provide direct connections to Davis Road, New N-S Minor Arterial Street, and Cross Avenue, which connects pedestrians and cyclists to the surrounding area's bike lanes, Oakville Transit bus stops, and the Oakville GO Station. Ensure internal pedestrian connections facilitate anticipated desire lines within and between development blocks. Ensure continuous, safe, and direct pedestrian connections with enhanced pedestrian amenities (landscaping, benches, shade, etc.) are provided.	Make walking and cycling an attractive option for travel during peak travel periods.
Building Infrastructure			
Pick-up / Drop off Facilities	Hard Measure	Provision of convenient pick-up and drop-off facilities within and around the development blocks to facilitate passenger pick-up and drop-off via shared use mobility services, short-term small scale residential deliveries (substituting for shopping trips)	Facilitate alternative means of travel other than private auto – use of shared auto services – reduces parking.
Secure Internal Package Storage facilities	Hard Measure	Consideration of internal residential building facilities to facilitate the secure drop-off of small parcels, packages, and potentially food deliveries	Increase opportunities to use delivery services during all times of day/week.
Monitoring			
Monitoring program – travel modal split, parking demands, bicycle parking demands	Soft Measure	Implement a program to monitor travel demand by mode as development is phased in over time. Respond to evolving demands and adjust mobility characteristics such as parking supply/configuration (review overall parking supply, adjust car-share resources) or bicycle parking supply/configuration (such as	Adapt to mobility changes over time with a view to reducing reliance on private use.

Measure	Type	Description	Objective
		introducing and/or increasing cargo bike, e-Bike, or e-Scooter storage facilities).	
Communication/ TDM Coordinator			
Resident / Retail Tenant Information Meetings	Soft Measure	Arrange meetings of new residents or retail tenants to communicate the available mobility resources to accommodate daily needs. Organized by building management or concierge staff within individual buildings.	Ensure the resident and tenant populations are kept informed of mobility options as they evolve over time within Midtown.
TDM Coordinator	Soft Measure	As requested by the Town, consideration is to be provided for hiring a TDM coordinator to implement the TDM strategy for the Site. Continued consultation is underway with the Town's Sustainable Transportation Program Coordinator for Smart Commute program options and implementation of TDM measures.	To oversee the implementation of TDM measures for the Site.

10.0 ROAD SAFETY AND TRAFFIC CALMING

To enhance the level of safety for all road users on residential streets within Oakville, the Town recently introduced the Neighbourhood Traffic Safety Program. This program includes the following components:

- Community Safety Zones
- Traffic calming
- Pedestrian crossovers
- Reduced default speed limit
- Vision Zero

The components of the Town's Neighbourhood Traffic Safety Program are summarized in **Table 15** and include consideration for how these measures would relate to the Site.

Table 15 Town's Neighbourhood Traffic Safety Program

Component	Description	Consideration for Site
Community Safety Zones	• Community Safety Zones (CSZ's) may include roadways near schools, daycare centres, active parks, hospitals and senior citizen residences, and may also be used for collision prone areas. • The Highway Traffic Act (HTA) allows municipalities to designate road segments as CSZs where public safety is of special concern and certain HTA fines (including speeding) are doubled.	• Once the Site is built-out, monitoring of the streets surrounding the Site (Local Street A, Local Street B and Davis Road) could be undertaken to determine if a Community Safety Zone is recommended.
Traffic Calming	• Traffic speeds at various locations in Oakville are measured through the speed survey program. • Traffic calming measures are used to reduce speeds where conventional methods of speed deterrence, such as enforcement and education, have not been effective. Some traffic calming examples include radar speed display signs, speed cushions, and raised barrier medians.	• Although the design of the Site street network has been designed to encourage lower speeds, once the Site is built-out, monitoring of the streets surrounding the Site could be undertaken to determine if additional traffic calming measures are required.

Pedestrian Crossovers PXO's)	• The Town has a Pedestrian Crossover (PXO) program. PXO's can be considered where a protected crossing is required for pedestrians. There are 4 different types of PXO's (as per the Ontario Traffic Manual Book 15), each providing a different level of protection.	• A PXO is being proposed for the Site along Davis Road, to provide a mid-block pedestrian crossing between the New N-S Arterial Street and Local Street B. This PXO will provide connectivity for pedestrians between Blocks 2 and 4.
Reduced Default Speed Limit	• In September 2023, Town Council voted to maintain the default speed limit of 50 km/h across all local and minor collector roads in Oakville as studies demonstrated that 40 km/h speed limits do not reduce operating speeds.	• Appropriate posted speed limits can be considered by the Town for the streets surrounding the Site at a later stage.
Vision Zero	• Vision Zero is a road safety approach with the goal of zero fatalities and zero serious injuries on roadways. • A key planning goal from the Town's 2018 Switching Gears Transportation Master Plan, was to provide a safe and efficient transportation system for all road users. • The Town currently has various initiatives to improve traffic safety as part of the Neighbourhood Traffic Safety Program, including education and outreach, network screening and crossing guard programs.	• Once the Site is operational, monitoring of the streets surrounding the Site could be undertaken to determine if there are road safety concerns that need to be addressed.

The design of the Site street network reviewed the 3 road safety pillars summarized in **Table 16**, with a focus on "Engineering". Once the Site is operational, the Town could address the "Education" and "Enforcement" pillars to address any road safety concerns. Road safety considers all road users, inclusive of pedestrians (focus on vulnerable users such as children, seniors, accessibility challenges) cyclists and vehicles.

Engineering measures that contribute to road safety include physical measures that focus on the design and operation of streets. The measures that impact road safety typically include traffic calming measures, changes to traffic control, traffic signal timing/coordination and pavement markings, signage, policy changes, review of design standards and changes to regulations such as traffic flow and parking rules.

The "Engineering" traffic calming measures that are proposed for the Site include street cross-sections that provide appropriate lane widths, on-street parking, curb extensions, a pedestrian crossover, dedicated facilities

for active transportation and boulevard landscaping. A pavement marking and signage plan will be provided as part of the SPA application.

Table 16 Road Safety Pillars

Engineering	Education	Enforcement
• Engineering includes safety measures that consider the physical and built environment, inclusive of the lay-out of the Site and design of the street network. • The proposed Site Street network include a functional design that considers road safety.	• Education includes widespread communication to provide information to the community about road safety. • The goal of education is to alter road user behaviour and increase the level of safety.	• Enforcement is a key component to improve driver behaviour and enhance the level of safety.

11.0 TRAFFIC VOLUME FORECASTING

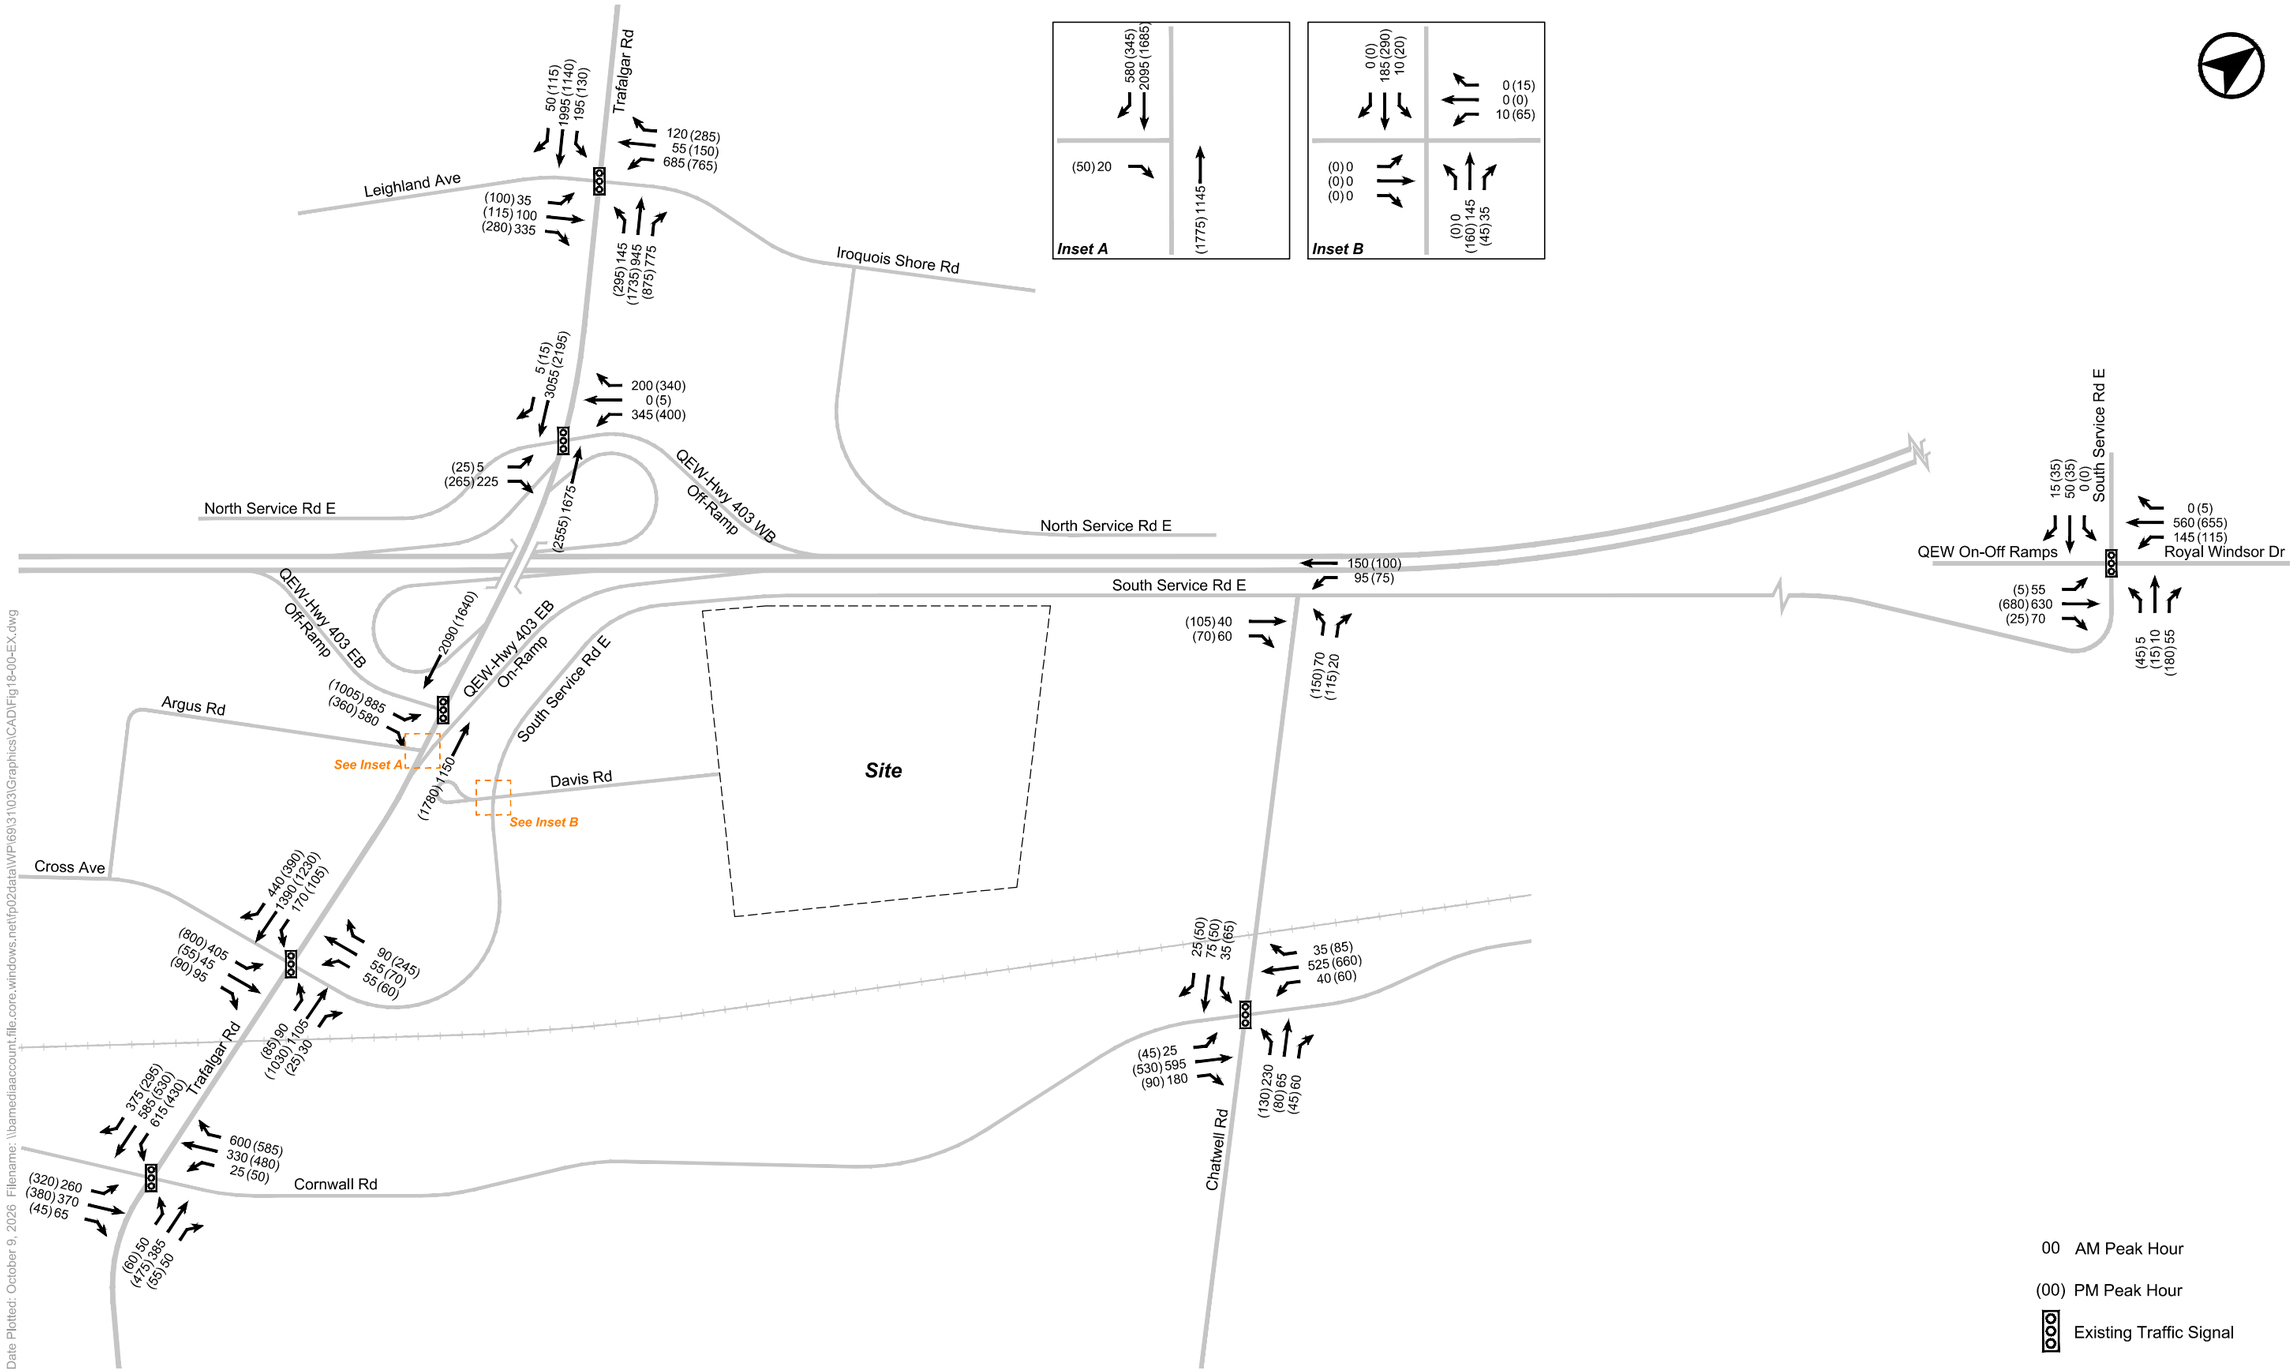
11.1 Traffic Analysis Scenarios

The traffic analysis has been undertaken for the weekday morning and afternoon peak hours.

The Town and the MTO have also requested that specific growth rates be applied along key corridors and the QEW/Hwy 403 ramps for analysis. This study therefore includes two scenarios for each horizon year: 1) **base** analysis without the requested corridor growth assumptions and 2) **sensitivity** analysis with corridor growth assumed. The justification for considering an analysis scenario without the sustained corridor growth, and why this scenario is most representative of future travel conditions, is provided in **Section 11.3.2**.

A summary of the traffic analysis scenarios considered for this report is as follows:

- Phase 1 build-out (**2031**);
    - 2031 Base traffic analysis (**without** additional corridor growth)
    - 2031 Sensitivity traffic analysis (**with** additional corridor growth)
- 5 years beyond build-out of Phase 1 (**2036**);
    - 2036 Base traffic analysis (**without** additional corridor growth)
    - 2036 Sensitivity traffic analysis (**with** additional corridor growth)
- Ultimate buildout of the entire Site (**2046**) - 20 years from the date of this study.
    - 2046 Base traffic analysis (**without** additional corridor growth)
    - 2046 Sensitivity traffic analysis (**with** additional corridor growth)



11.2 Existing Traffic Volumes

Existing baseline traffic and pedestrian volumes were established at intersections within the study area for the weekday morning and afternoon peak hour, using traffic count information obtained from surveys conducted by Spectrum Traffic Data Inc. on Tuesday, June 4, 2024. A list of the count data and sources is provided in **Table 17**. All turning movement counts are provided in **Appendix L.**

Table 17 Study Area Intersections

Intersections	Type of Control	Count Date	Source
Trafalgar Road / Iroquois Shore Road / Leighland Avenue	Signalized	Tuesday, June 4th, 2024	Spectrum Traffic Data Inc.
Trafalgar Road / North Service Road / QEW-Hwy 403 Westbound Off-Ramp			
Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp			
Trafalgar Road / Cross Avenue			
Trafalgar Road / Cornwall Road			
Cornwall Road / Chartwell Road			
QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East			
Trafalgar Road / Argus Road	Stop Control		
Chartwell Road / South Service Road East			
South Service Road East / Davis Road			

The existing turning movement counts were reviewed in detail to ensure a general consistency in the traffic volumes on roadways between intersections. Existing, balanced baseline area traffic volumes for the weekday morning and afternoon peak hours are illustrated in **Figure 18**.

Date Plotted: October 9, 2026 Filename: \\bamediaaccount.file.core.windows.net\fp02data\WP\69\31\03\Graphics\CAD\Fig18-00-EX.dwg

FIGURE 18 EXISTING TRAFFIC VOLUMES

11.3 Future Background Traffic

Traffic growth in the Site vicinity is based on a review of both background development traffic allowances and general corridor growth along key study area corridors, in each horizon year of 2031, 2036 and 2046.

11.3.1 Background Development Traffic

A total of 9 background developments were included as background growth on the study area road network. This comprehensive list was obtained from the active applications available on the Town of Oakville's website and in correspondence with Town staff. **Table 18** provides a summary of the background developments considered in this study. These developments represent in the order of 8,000 residential units and almost 20,000 m^2 GFA of non-residential uses. Background development traffic volumes are shown in **Figure 28**.

It is expected that most of these developments would be built out by the earliest horizon year of 2031, with the exception of 590 Argus Road, 157 & 167 Cross Avenue, and 217 Cross Avenue & 571 Argus Road. As of the date of this study, these latter three developments are expected to be built out by the furthest horizon year of 2046. **Appendix M** includes a summary of the background developments and the respective trip generation that was generated or published in respective traffic studies where available.

Table 18 Area Background Developments

Location	Development Statistics		Source[1]	Date
	Residential (Units)	Non-Residential[2] (m^2 GFA)		
271 Cornwall Road	317	960	R. J. Burnside Traffic Study	August 2020
627 Lyons Lane	281	--	Paradigm Traffic Study	May 2022
349 Davis Road	388	2,152	Crozier Traffic Study	May 2023
599 Lyons Lane	480	--	Generated	
177 Cross Avenue	552	3,045	Generated	
590 Argus Road[3]	1,669	1,956	Generated; Application in Progress	
157 & 167 Cross Avenue[3]	1,099	3,788	Generated; Application in Progress	
217 Cross Avenue & 571 Argus Road[3]	1,762	3,168	Generated; Application in Progress	
166 South Service Road[3]	1,663	4,018	Generated; Application in Progress	
Total	**8,211**	**19,087**	**--**	

Notes:
1. Where no traffic figure exist, trips were generated with trip generation rates selected for the Site.
2. Non-residential uses include retail, commercial, daycares, health clubs and office.
3. The applications for these developments are currently in progress, and statistics are subject to change. The assumed statistics are best estimates only.

11.3.2 Corridor Growth Considerations

General corridor growth volumes are non-local to the Midtown Oakville area, making use of the capacity within the immediate study area road network to pass-through the area to reach a destination in another district. By its definition, corridor growth excludes local growth within the Midtown Oakville area that arises due to background development and site growth.

Historical traffic volume counts from 2001 to 2024 at the Trafalgar Road / Cross Avenue and Trafalgar Road / Cornwall Road intersections were reviewed to determine if there have been any changes in traffic activity due to pass-through demand. It was determined that traffic volumes along Trafalgar Road, Cross Avenue and Cornwall Road have remained consistent or even declined during this period. The detailed corridor growth studies, including visual data trends of corridor volumes, are provided in **Appendix N**.

Given the future character of Midtown Oakville as a transit-oriented context, it is expected that the currently observed trends of negligible growth along key travel corridors will continue. Though historical data was not available at all other corridors or ramps in the area, these declining or negligible growth trends are expected to continue throughout, especially given the rise in local development and densification (considered through the background development list). As the area approaches capacity into the future, it is expected that local neighbourhood traffic would begin to displace non-local traffic that is currently encouraged to pass through the area. Study area corridors and the QEW-Hwy 403 ramps that were once attractive alternatives to other route options will more likely be avoided, due to local traffic utilizing more capacity during peak travel periods. Future transit infrastructure improvements, such as the Trafalgar Bus Rapid Transit, would cause a necessary shift in existing travel mode choice that would further reduce the reliance on single-occupancy vehicles and congestion and delays in the area. This projection would be consistent with the designation of Midtown Oakville as an “Anchor Mobility Hub” (by Metrolinx[1]) and a “Major Transit Station Area” (by Halton Region). On this basis, it is most likely that corridor growth volumes on key corridors will remain negligible or even decline, as the Midtown Oakville area evolves into the future.

As per request by the Town and MTO, the analysis undertaken in this study will therefore consider 1) a **base case where the area will not experience corridor growth,** in keeping with the designation as a transit-oriented community neighbourhood and 2) a **sensitivity case where corridor growth assumptions are included** in the analysis of all future horizons.

11.3.2.1 Requested Corridor Growth

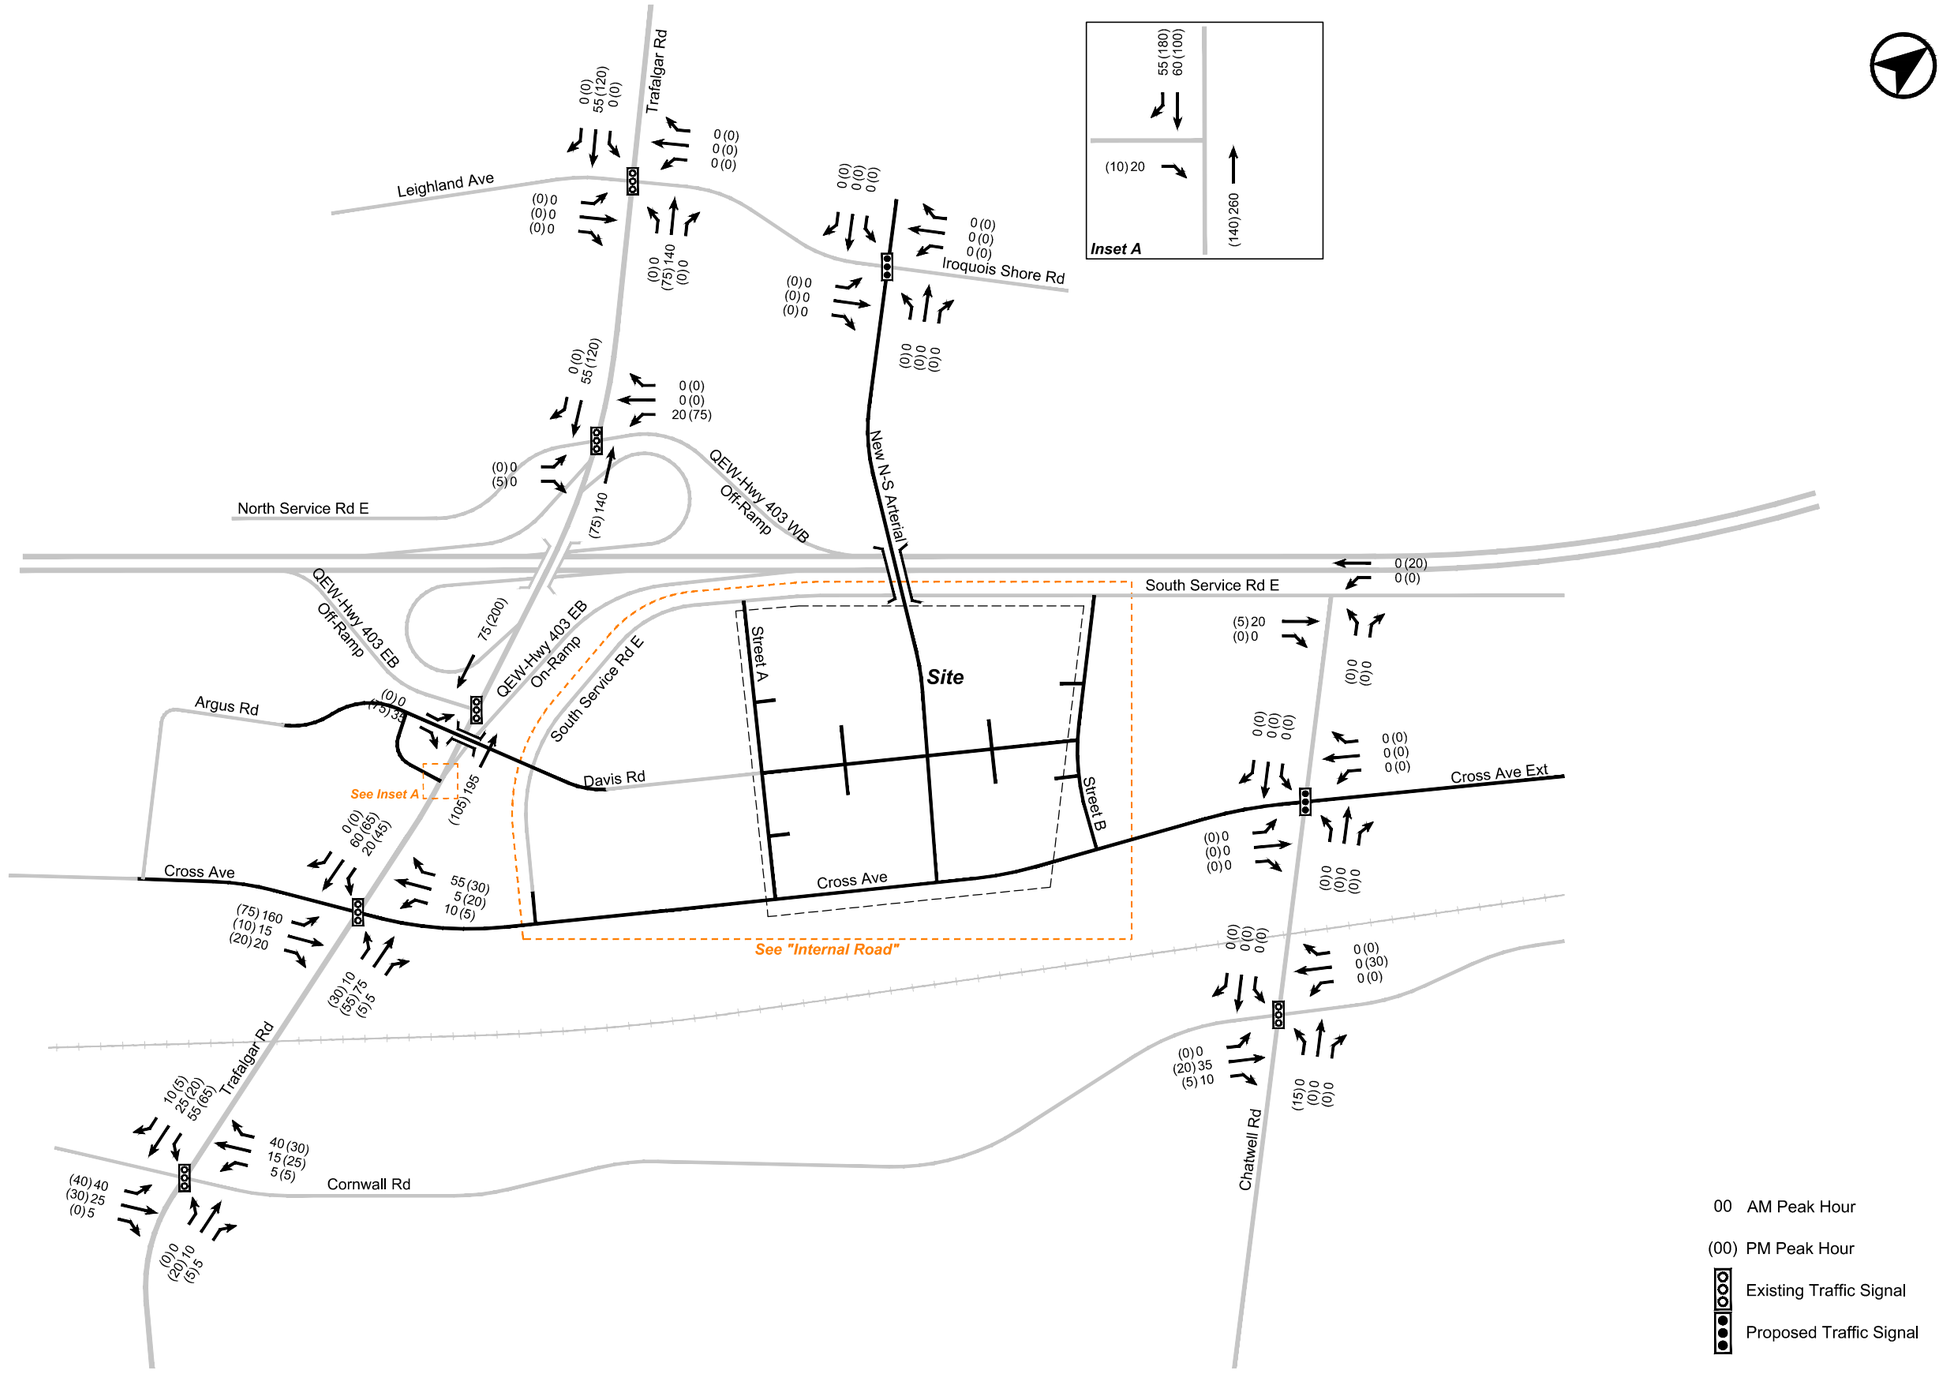
The MTO has requested that a 3.1% annual growth rate be added to all QEW-Hwy 403 off-ramp movements, while the Town of Oakville has requested that a 3% annual growth rate be added to all municipal roads in the study area. Recognizing that the study’s furthest horizon is 20 years, the compounded traffic volumes from these growth rates result in the order of over a thousand vehicles being added to Trafalgar Road and hundreds of vehicles being added to other municipal roads.

Even without any local development, this theoretical volume growth will far exceed the remaining capacity along Trafalgar Road (which is already experiencing busy urban travel conditions) and the additional capacity afforded by the future road network improvements that are planned for Midtown Oakville and intended to improve these pre-existing congestion areas.

[1] Midtown Oakville is discussed on page 20 of Metrolinx’s *Mobility Hub Policy Review* (dated 2018).

While it is important to plan for future growth, a comprehensive review of area background developments was undertaken and is considered representative of future background traffic at the study horizon. The area's existing capacity constraints and future transit-oriented context would continue to limit sustained significant growth (for up to two decades to the furthest horizon of 2046) to be highly unlikely and unsustainable for the road network, even prior to the development of any other density in the area.

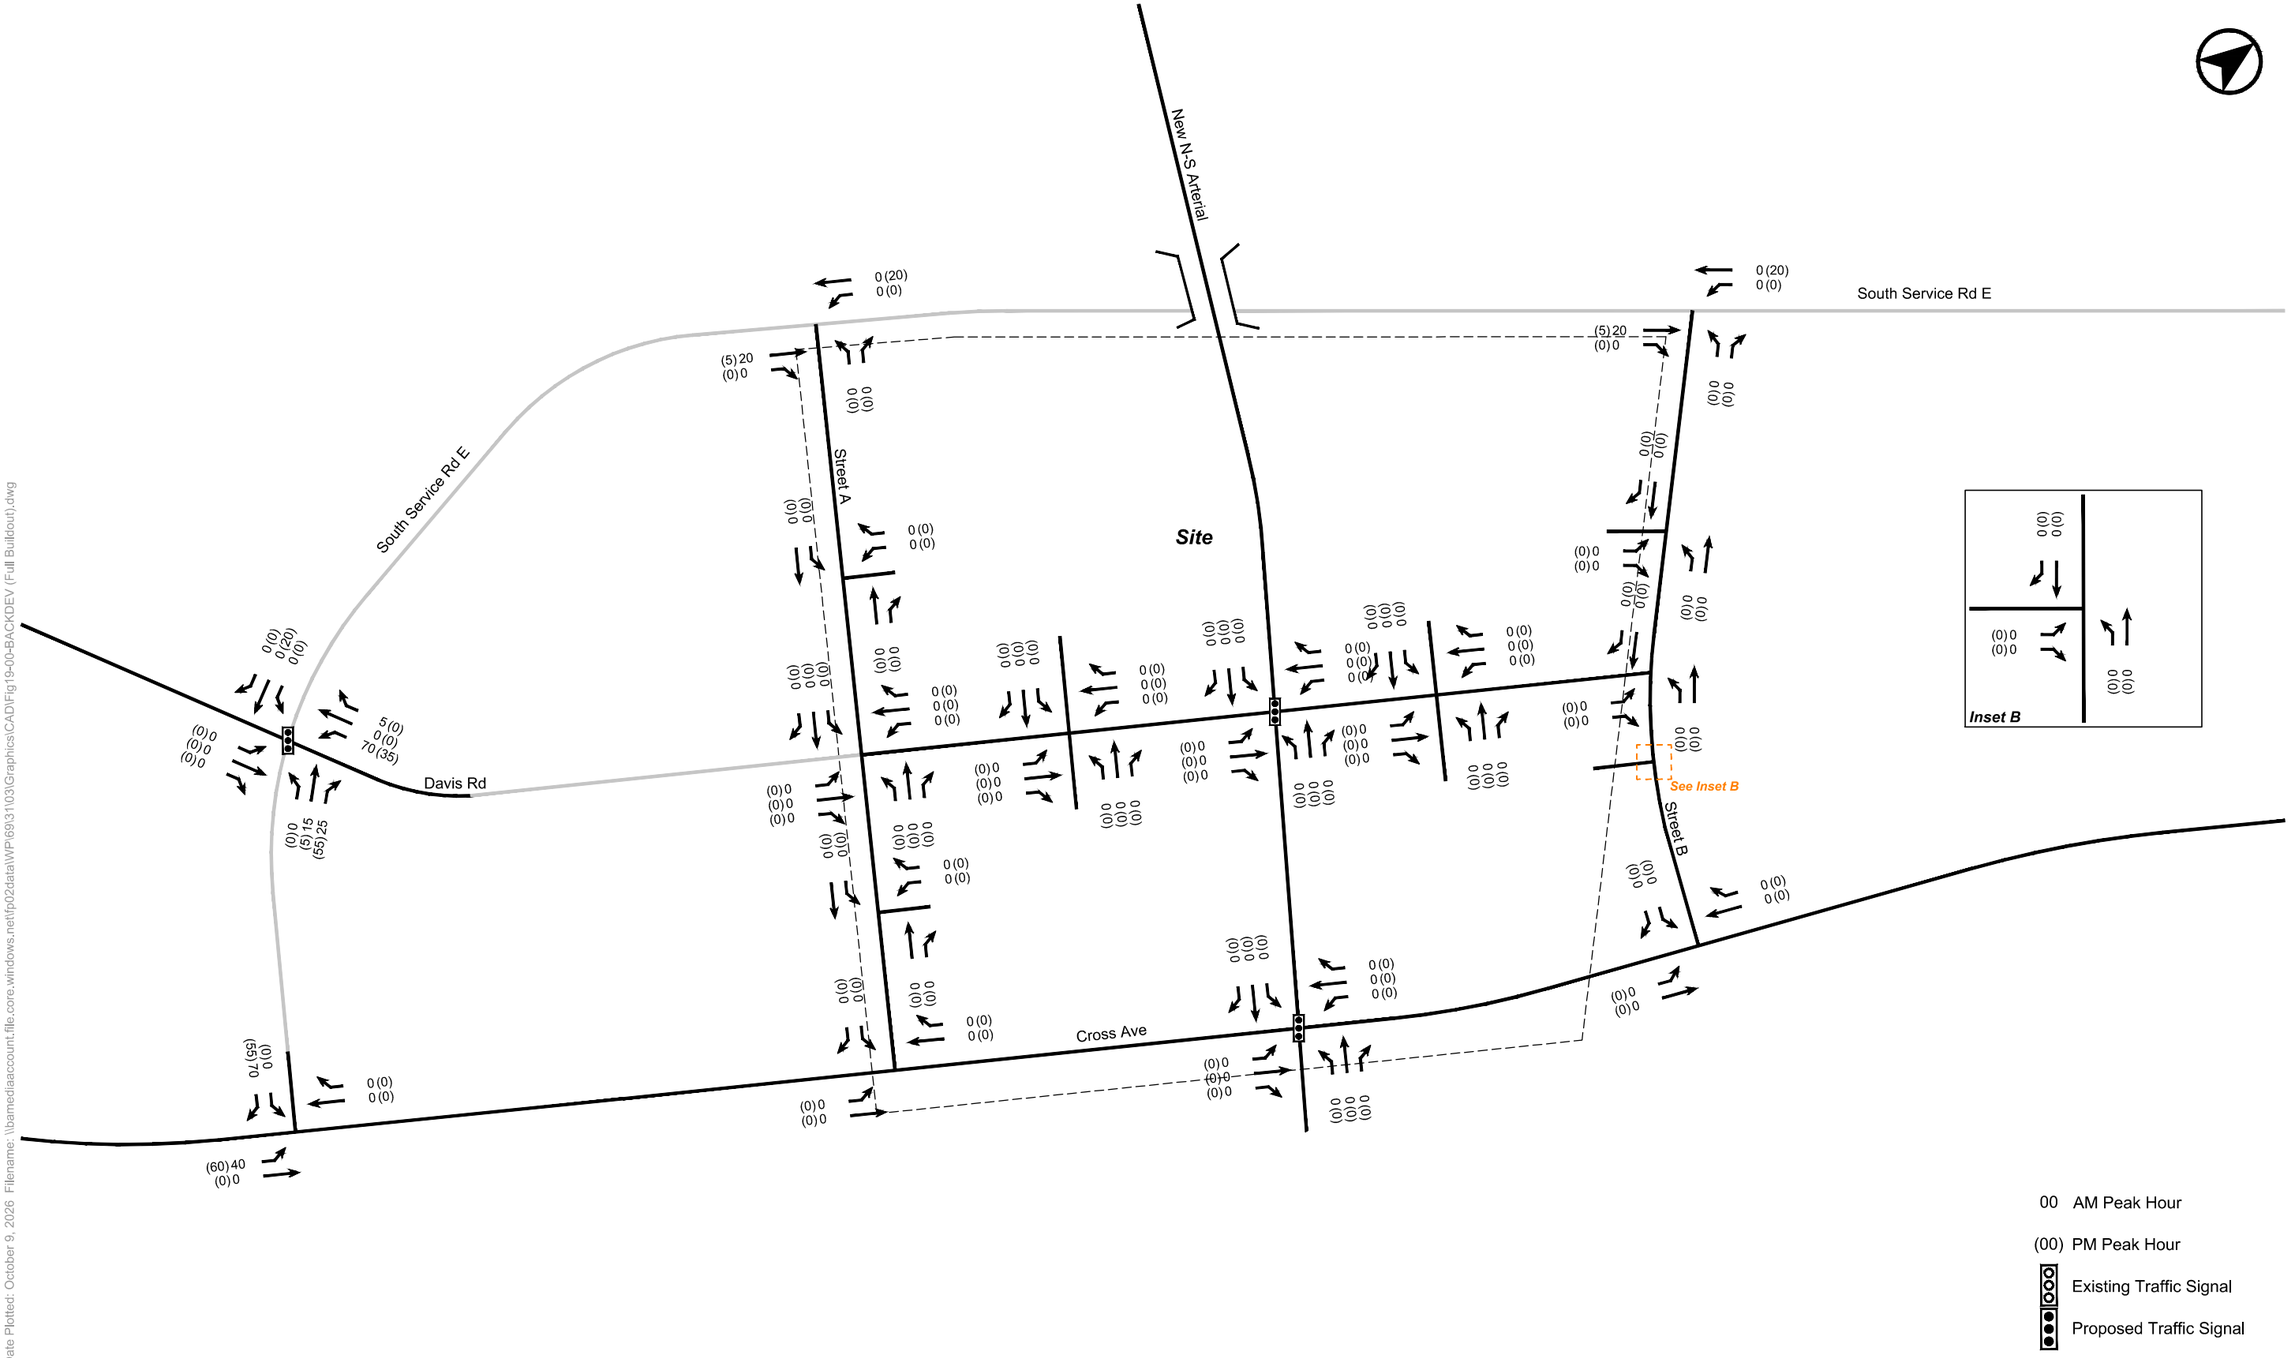
As the area around the Site develops, drivers who do not need to access a specific destination within the Site area (such as a background development or the GO station), will likely choose alternative routes with more capacity available, or travel via other travel modes. For this reason, for comparison purposes only, the traffic analysis scenarios within this report include the future background and future total scenarios **with and without the addition of the MTO and Town growth** to each horizon year.



11.3.3 Traffic Volume Figures

Background development traffic volumes on the study area road network are illustrated in **Figure 19**.

Corridor growth traffic volumes on the study area road network are illustrated in **Figure 21**, **Figure 22** and **Figure 22** for the 2031, 2036 and 2046 horizon years, respectively.



The base case future background traffic volumes consist of existing traffic volumes plus background development traffic volumes and are illustrated in **Figure 23**, **Figure 24** and **Figure 25** for the 2031, 2036 and 2046 horizon years, respectively.

The sensitivity future background traffic volumes that include corridor growth traffic volumes are illustrated in **Figure 26**, **Figure 27** and **Figure 28** for the 2031, 2036 and 2046 horizon years, respectively.

11.4 Site Traffic Volumes

11.4.1 Forecasting Approach

Gross vehicle trip generation for the Site has been established for each land use, using trip generation rates from the 12th Edition of the ITE Trip Generation Manual (released August of 2025). Given that this study also includes the traffic analysis for Phase 1, trip forecasts include both Phase 1 and the full buildout of the Site.

Internal trip making "interactions" between land uses within the Site, have also been considered. Given that the proposed development includes 4 mixed-use blocks, it is expected that the following 2 types of internal interactions will occur:

1. Interaction between the residential uses and the retail uses within each block; and
2. Interaction between the blocks and within the overall Site.

Interaction trips were calculated based on the interaction effects for each land use pairing as published in Chapter 6 of the ITE Trip Generation Handbook (3rd edition dated September 2017), a current standard for determining interaction rates. The resulting internal trip interactions considers the trip-making constraints at either trip end, so as to not double count remaining external trip-making.

Gross vehicle trip forecasting (which includes both external and internal trips) was completed for each of the residential and retail uses of the development, as described in the following sections.

11.4.2 Residential Gross Trip Generation

Vehicle trip generation rates for the residential uses have been determined from the 12th Edition of the ITE Trip Generation Manual. In recognition of the Site's proximity to the Oakville GO and ultimate build-out condition of Midtown Oakville, which will be a multi-use, 'complete' community, ITE Land Use Code 222: Multifamily Housing (High-Rise) (for sites that are located in dense multi-use urban areas and are located close to rail transit) was selected as the most appropriate vehicle trip generation rate for the ultimate build-out of the Site. The selected rate for vehicle trip generation and the expected number of gross residential vehicle trips, are summarized in **Table 19**.

Justification for the use of the **ITE Land Use Code 222: Multifamily Housing (High-Rise) (for sites that are located in dense multi-use urban areas and are located close to rail transit**), is provided as follows:

- The ITE manual defines "Dense Multi-Use Urban" as follows:
    - "*A fully (or nearly fully) developed area with diverse and interacting complementary land uses; good pedestrian connectivity; and convenient and frequent transit. It may be a well-developed urban area outside a major metropolitan downtown or a mid-sized urban area downtown. Common land uses include office, retail, residential, entertainment, hotel, and other commercial uses. The residential uses are typically multifamily or single-family on lots no larger than one-fourth acre. Buildings often have minimal setbacks from the sidewalk. Vehicles remain the primary mode of travel, but the area also supports walking, biking, and transit. Parking is provided on and off-street. The complementary land uses in dense multi-urban areas provide the opportunity for short trips within the area, made convenient by walking, biking, or transit. Significant transit access, such as rail or bus, supports high transit mode share." (page 12 of Chapter 4 – Definition of Terms).*

- The above-noted definition is much more suitable to the evolving nature of the Site's context compared to the "General Urban/Suburban" setting.
- ITE defines "close to rail transit" as
    - "*a site is considered close to rail transit if the walking distance between the residential site entrance and the closest rail transit station entrance is ½ mile (800 metres) or less.*"
- Given the future transit-oriented context of the Site, the application of ***the ITE Land Use Code 222: Multifamily Housing (High-Rise) (for sites that are located in dense multi-use urban areas and are located close to rail transit)*** is appropriate, especially given that the existing GO station is approximately a one kilometre (1,000 metres) walk from the site (around 12-15 minutes), assuming a 1.2 m/s walking speed. The difference in walk time for 800 metres versus 1000 metres, is approximately 2 minutes.
- Given that the Site is planned to be a transit-oriented community, the assumption for trip rates is considered to be reasonable. With future transit improvements such as the Trafalgar BRT, it is expected that transit travel will become increasingly more attractive into the future in line with Town planning policies and initiatives.

To be conservative, the unit count for the residential units has been rounded up to the nearest 50 units for each block, such that the traffic analysis has been undertaken for a total of 5,800 residential units, which represents an additional 200 residential units than proposed within the current Site Plan.

The residential uses within Phase 1 of the site are expected to generate 405 and 355 two-way gross vehicle trips during the weekday morning and afternoon peak hours, respectively. At full buildout, the residential uses of the Site are expected to generate 1,270 and 1,105 two-way gross vehicle trips, during the same peak hours.

Table 19 Residential Gross Vehicle Trip Generation

Block	Number of Units		AM Peak Hour			PM Peak Hour		
	As Per Site Plan	Used for Analysis	In	Out	2-Way	In	Out	2-Way
ITE LUC 222: Multifamily Housing (High-Rise) (**Dense Multi-Use Urban – Close to Rail Transit**) [2]			0.02	0.20	0.22	0.13	0.06	0.19
Block 1 (Phase 1)	*1,800*	1,850	45	360	405	245	110	355
Block 2	*1,750*	1,800	45	350	395	235	105	340
Block 3	*1,050*	1,100	25	215	240	145	65	210
Block 4	*1,000*	1,050	25	205	230	140	60	200
Phase 1 Gross Trips	***1,800***	**1,850**	**45**	**360**	**405**	**245**	**110**	**355**
Full Buildout Gross Trips	***5,600***	**5,800**	**140**	**1,130**	**1,270**	**765**	**340**	**1,105**

Notes:
1. Gross vehicle trips represent the theoretical amount of vehicle trips if no other uses are present on the Site. Given that there are other uses proposed in Phase 1 and at full buildout, internal trip capture will reduce the actual number of vehicle trips experienced on the study area road network. This concept is explained in detail in Chapter 6 of ITE's Trip Generation Handbook and will be discussed in **Section 11.4.5**.
2. Note that *exact* trip rates were used based on the two-way ITE trip rates multiplied to the directional distribution provided by the ITE manual. For example, the inbound weekday morning trip rates are 0.0242 if more decimal places could be shown in the cell.

11.4.2.1 OPA 70 Maximum FSI Considerations

As per the Town comment, the gross trip generation resulting from the proposed density has been compared to the trip generation resulting from the maximum floor space indexes (FSI) for the Site, as identified under OPA 70. The maximum FSI of the Site is 4.0, north of Davis Road (Blocks 1 and 2) and 3.0 south of Davis Road (Blocks 3 and 4). On this basis, a total of approximately 4,165 units across the four blocks was estimated as the maximum density for the Site. The trip generation comparison is provided in **Table 20**. Based on the comparison, the current development proposal for the Site yields a 39% increase in density compared to the maximum FSI considerations, with a proportional 39% increase in vehicle trip generation.

Table 20 Proposed vs. Maximum FSI Trip Generation

	Density (Units)	AM Peak Hour			PM Peak Hour		
		In	Out	2-Way	In	Out	2-Way
Maximum FSI	4165	100	820	920	550	245	795
Proposed Site	5800	140	1130	1270	765	340	1105
Quantitative Difference	**+1635**	**+40**	**+310**	**+350**	**+215**	**+95**	**+310**
Percent Difference[1]	**+39%**	**--**	**--**	**+38%**	**--**	**--**	**+39%**

Notes:
1. Percent difference is calculated relative to the maximum permitted FSI.

11.4.3 Retail Gross Trip Generation

Vehicle trip generation for the retail uses across all blocks has been determined from the 12th Edition of the ITE Trip Generation Manual. Given that the dense multi-use urban land use code did not provide sufficient data (only 2 data points in the PM peak hour), the general urban / suburban filter, was selected. Furthermore, Land Use Code 821 Shopping Plaza[2] was selected, given that the site plan currently proposes approximately 9,118 m^2 GFA of retail, and the retail uses are intended and designed to serve the entire Site community and operate cohesively, not as individual blocks. The corresponding ITE trip generation rate (converted to trips / 100 m^2 GFA, since ITE provides rates in trips / 1,000 ft^2 GFA) and the resultant gross retail vehicle trips, are summarized in **Table 21**.

For the purposes of the trip generation forecasting, all retail GFA's for each block were rounded up to the nearest 50 m^2 in order to ensure a conservative traffic analysis.

The retail uses within Phase 1 of the site are expected to generate 25 and 80 two-way gross vehicle trips during the weekday morning and afternoon peak hours, respectively. At full buildout, the retail uses of the Site are expected to generate 155 and 470 two-way gross vehicle trips, during the same peak hours.

[2] The proxy data under LUC 821 include developments with between 40,000 and 150,000 square feet of gross leasable area. See page 110 of the ITE Trip Generation Manual (12th Edition) for more details.

Table 21 Retail Gross Vehicle Trip Generation

Block	GFA (m^2)	AM Peak Hour			PM Peak Hour		
		In	Out	2-Way	In	Out	2-Way
ITE LUC 821: Shopping Plaza Converted rates to **trips / 100 m^2 GFA**		1.07	0.65	1.71	2.51	2.62	5.12
Block 1 (Phase 1)	1,503	15	10	25	40	40	80
Block 2	1,514	15	10	25	40	40	80
Block 3	3,293	35	20	55	80	85	165
Block 4	2,808	30	20	50	70	75	145
Phase 1 Gross Trips	**1,503**	**15**	**10**	**25**	**40**	**40**	**80**
Full Buildout Gross Trips	**9,118**	**95**	**60**	**155**	**230**	**240**	**470**

Notes:
1. The effective gross floor area adopted for conservative trip generation purposes only is 9,250 m^2 GFA after rounding the gross floor areas of each block upwards to the nearest 50 m^2. The actual site statistics are summarized in the table above.
2. Gross vehicle trips represent the theoretical amount of vehicle trips if no other uses are present on the Site. Given that there are other uses proposed in Phase 1 and at full buildout, internal trip capture will reduce the actual number of vehicle trips experienced on the study area road network. This concept is explained in detail in Chapter 6 of ITE's Trip Generation Handbook and will be discussed in **Section 11.4.5**.

11.4.4 Summary of Gross Vehicle Trip Forecasting

A summary of the gross vehicle trips generated by the residential and retail uses proposed for the Site, is provided in **Table 22**. Phase 1 of the Site is expected to generate 430 and 435 two-way gross vehicle trips during the weekday morning and afternoon peak hours, respectively. At full buildout, the Site is expected to generate 1,425 and 1,575 two-way gross vehicle trips, during the same peak hours.

Table 22 Total Gross Vehicle Trip Generation

Block	AM Peak Hour			PM Peak Hour		
	In	Out	2-Way	In	Out	2-Way
Residential						
Block 1 (Phase 1)	45	360	405	245	110	355
Block 2	45	350	395	235	105	340
Block 3	25	215	240	145	65	210

Gross Vehicle Trips	**235**	**1,190**	**1,425**	**995**	**580**	**1,575**

11.4.5 Site Interaction Considerations

The presence of multiple land uses (i.e., the residential and retail uses) within the proposed development for the Site, supports the potential for internal trips between these uses. These trips are not considered to be external to the Site, but rather, will be made primarily by walking between the uses within the proposed development. As a result, the total external trip generation is expected to be less than the sum of the trips that are generated by each individual land use. The methodology for internal trip capture is described in detail in Chapter 6 of the ITE Trip Generation Handbook (3rd Edition). The excerpts are provided in **Appendix O**.

These internal trips are removed from the trip generation potential of both the origin land use and the destination land use (i.e., from both "ends" of the "O-D" pairing). For example, one internal trip that originates from the residential component and ends in the retail component of the Site is equivalent to one outbound internal trip for the residential component and one inbound internal trip for the retail component. If the residential component is forecasted to generate 10 total outbound trips in an hour, 1 of those outbound trips would be internal, while the remaining 9 outbound trips would be external. It can also be stated in an equation as:

Gross Trip Generation Potential of Each Land Use = Internal trips + External trips

Subsequently, external site trips for each specific land use are equal to the total site trips for each land use minus the internal site trips. The external site trips represent the trips that would ultimately be added to the area transportation network. In order to estimate the number of internal trips to and from each land use to another, the methodology outlined in Chapter 6 of the ITE Trip Generation Handbook was adopted for analysis purposes. Detailed calculations for the internal trips resulting from the Phase 1 development and the full buildout development, are presented in **Appendix O**. The ITE's published interaction trip rates and resulting internal trips are summarized in **Table 23** and **Table 24**, respectively.

Table 23 Interaction Trip Rate by Land Use

	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
Site Residential				
With Retail	2%	1%	46%	42%
Site Retail				
With Residential	17%	14%	10%	26%

Table 24 Internal Site Trip Capture

	Destination	Origin	AM Peak Hour	PM Peak Hour
Phase 1	To Residential	From Retail	0	10
	To Retail	From Residential	5	5
	Full Buildout Internal Trip Capture		**5**	**15**
Full Buildout	To Residential	From Retail	5	60
	To Retail	From Residential	10	25
	Full Buildout Internal Trip Capture		**15**	**85**

Notes:
1. Internal trips rounded to the nearest 5.
2. Internal trips are removed from the gross trips to obtain external trips on the study area road network.

11.4.6 External Trip Generation and Trip Generation Summary

External trip generation for each land use was then calculated based on the respective gross trip generation and the internal trip generation for both Phase 1 and the full buildout of the Site. A summary of the total, external, and internal site trips during the peak hours is provided in **Table 25**. As per Town comment, the gross, internal and external trips are outlined separately below.

Phase 1 (Block 1)

Phase 1 of the Site is expected to generate **430 and 435 two-way gross trips** during the weekday morning and afternoon peak hours, respectively.

Of the gross two-way trips, Phase 1 is expected to generate **10 and 30 internal trips** during the peak hours between the residential and retail uses. These internal trips occur within the Site and do not cause any traffic-related impacts to the surrounding area road network.

Phase 1 is also expected to generate **420 and 405 two-way external trips** during the weekday morning and afternoon midday peak hours, respectively. These external vehicle trips will be experienced by the surrounding area road network.

Full Buildout

The full buildout of the Site is expected to generate **1,425 and 1,575 two-way gross trips** during the weekday morning and afternoon peak hours, respectively.

Of the gross two-way trips, the Site is expected to generate **30 and 170 internal trips** during the peak hours between the residential and retail uses. These internal trips occur within the Site and do not cause any traffic-related impacts to the surrounding area road network.

The Site is also expected to generate **1,395 and 1,405 two-way external trips** during the weekday morning and afternoon midday peak hours, respectively. These external vehicle trips will be experienced by the surrounding area road network.

Table 25 Internal and External Trip Generation (Phase 1 and Full Buildout)

Land Use	Trip Type	AM Peak Hour			PM Peak Hour		
		In	Out	2-Way	In	Out	2-Way
Phase 1 of Site (Block 1)							
Residential	Gross	45	360	405	245	110	355
	Internal	0	-5	-5	-10	-5	-15

	External	**220**	**1175**	**1395**	**910**	**495**	**1405**

11.4.7 Retail Pass-by Trip Generation

As per the ITE Trip Generation Handbook, a portion of the external retail trips are expected to be pass-by trips. The pass-by trip methodology is detailed in Chapter 10 of the Handbook.

Pass-by trips are defined as trips that do not add new traffic to the adjacent street system but instead are trips passing the site on the way from an origin to an ultimate destination. It is noted that “primary trips” are trips where the ultimate origin or destination is the Site, or where the driver’s specific purpose is visiting the Site.

Updated pass-by percentages were based on the data provided within the supplement for the ITE Trip Generation Manual, 12th edition. Since no data was available for the weekday morning peak hour, all trips were taken as primary trips in that period.

A full summary of the gross, internal, external and resulting retail pass-by trips pertaining to each block and the full buildout of the Site is provided in **Appendix P**.

Phase 1 of the Site is expected to generate a total of 30 pass-by trips during the weekday afternoon peak hour. With the full buildout of the Site, a total of 160 pass-by trips are expected during that same hour.

Table 26 Retail Vehicle Trips

	AM Peak Hour			PM Peak Hour		
	In	Out	2-Way	In	Out	2-Way
Phase 1 of Site (Block 1)						
Total Retail Vehicle Trips	10	10	20	35	30	65
Pass-by Percentage[1]	0%			40%		
Pass-by Trips	**0**	**0**	**0**	**15**	**15**	**30**
Primary Trips	**10**	**10**	**20**	**20**	**15**	**35**
Full Buildout of Site						
Total Retail Vehicle Trips	85	55	140	205	180	385
Pass-by Percentage[1]	0%			40%		
Pass-by Trips	**0**	**0**	**0**	**80**	**80**	**160**
Primary Trips	**85**	**55**	**140**	**125**	**100**	**225**

Notes:
1. The ITE supplement does not include any data for weekday morning peak hour pass-by percentages. A conservative 0% was assumed for analysis purposes. In the weekday afternoon peak hour, the ITE supplement lists an average of 40% of all trips as being pass-by trips for surveyed data under LUC 821.

11.4.8 Trip Distribution and Assignment

Residential Trip Distribution

The distribution of residential Site trips on the study area road network is based on a review of the home-based trip distribution data provided by the Transportation Tomorrow Survey, as well as the consideration of capacity constraints at several locations on the network. The general distribution of inbound and outbound residential traffic is summarized in **Table 27**. While a set of trip distribution percentages is assumed for analysis purposes, it is likely that drivers will redistribute across a wider area, depending on where congestion and delays persist in any given period or day. The estimated distribution to each of the available corridors in each direction, has been undertaken using engineering judgment and the consideration of pre-existing capacity constraints. Furthermore, Phase 1 of the Site was analyzed with the assumption that only the existing road network would be in place, without any additional road improvements completed. Future road improvements, such as the new QEW-Hwy 403 interchange configuration at Royal Windsor Drive, the New N-S Arterial Street, the Argus Road extension, Cross Road extension, etc., were not assumed as part of the trip distribution.

Under the full build-out of the Site, all future road improvements were assumed to have been completed. The need for each of the planned road improvements, as per the Midtown Oakville Transportation Plan (dated March 19, 2026, by R. J. Burnside) would be further considered with subsequent phases of the Site. However, as discussed in **Section 12.0** of this report, it was confirmed that no further improvements to the existing road network are required to accommodate the development of Phase 1.

Table 27 Residential Trip Distribution

Route	From / To (Direction)	Inbound	Outbound
Trafalgar Road / New N-S Arterial Street	North	20%	25%
	South	10%	10%
QEW-Hwy 403	East	30%	30%
	West	15%	10%
Cornwall Road	East	5%	5%
	West	10%	10%
Royal Windsor Drive	East	5%	5%
Chartwell Road	South	5%	5%
Total		**100%**	**100%**

Notes:
1. Based on a review of home-based trips to and from TTS zones 4013-4015, 4017, 4027, 4029 and 4030, for outbound trips beginning between 6:00 a.m. – 8:59 a.m. and inbound trips beginning between 3:00 p.m. – 5:59 p.m.

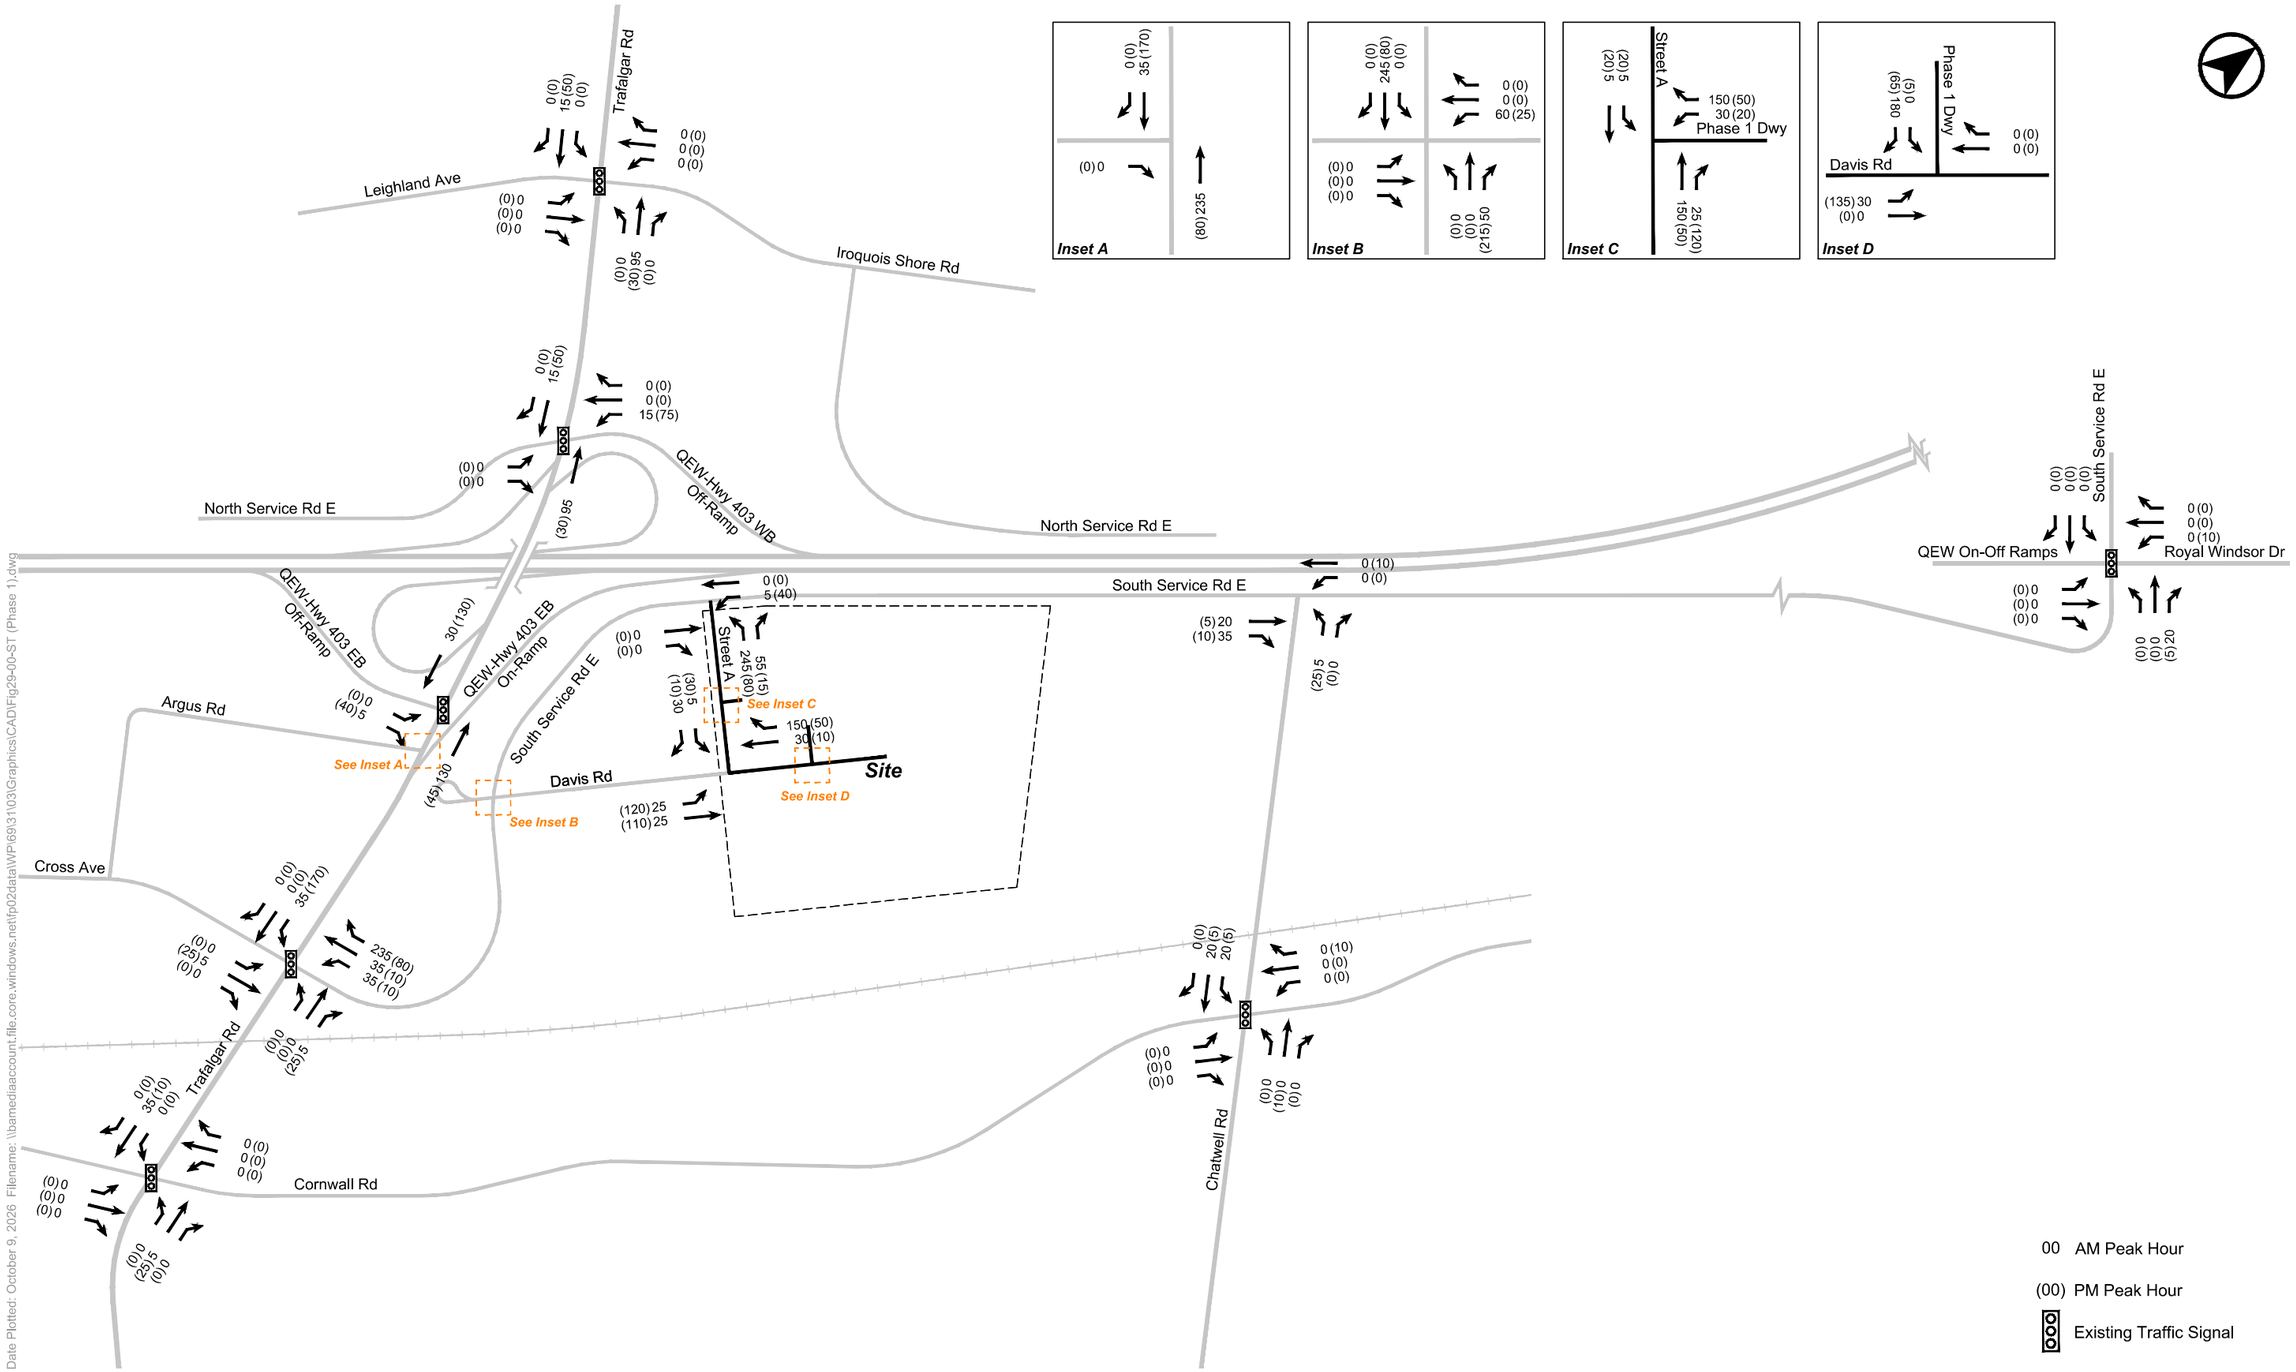
Retail Trip Distribution

The retail trip distribution pattern for the Site has been based on a review of the 2022 TTS for retail-destined trips to and from the study area during the weekday morning and afternoon peak hours. The distribution of inbound and outbound retail traffic is summarized in **Table 28**.

Similar to residential trips, while a set of trip distribution percentages was assumed for analysis purposes, it is likely that drivers will redistribute across a wider area depending on where congestion and delays persist within any given period or day. The estimated distribution to each of the available corridors, in each direction, has been undertaken using engineering judgment and the consideration of pre-existing capacity constraints.

Table 28 Retail Trip Distribution

Route	From / To (Direction)	Inbound	Outbound
Trafalgar Road / New N-S Arterial Street	North	35%	35%
	South	10%	10%
QEW-Hwy 403	East	15%	15%
	West	15%	15%
Cornwall Road	East	5%	5%
	West	10%	10%
Royal Windsor Drive	East	5%	5%
Chartwell Road	South	5%	5%
Total		**100%**	**100%**

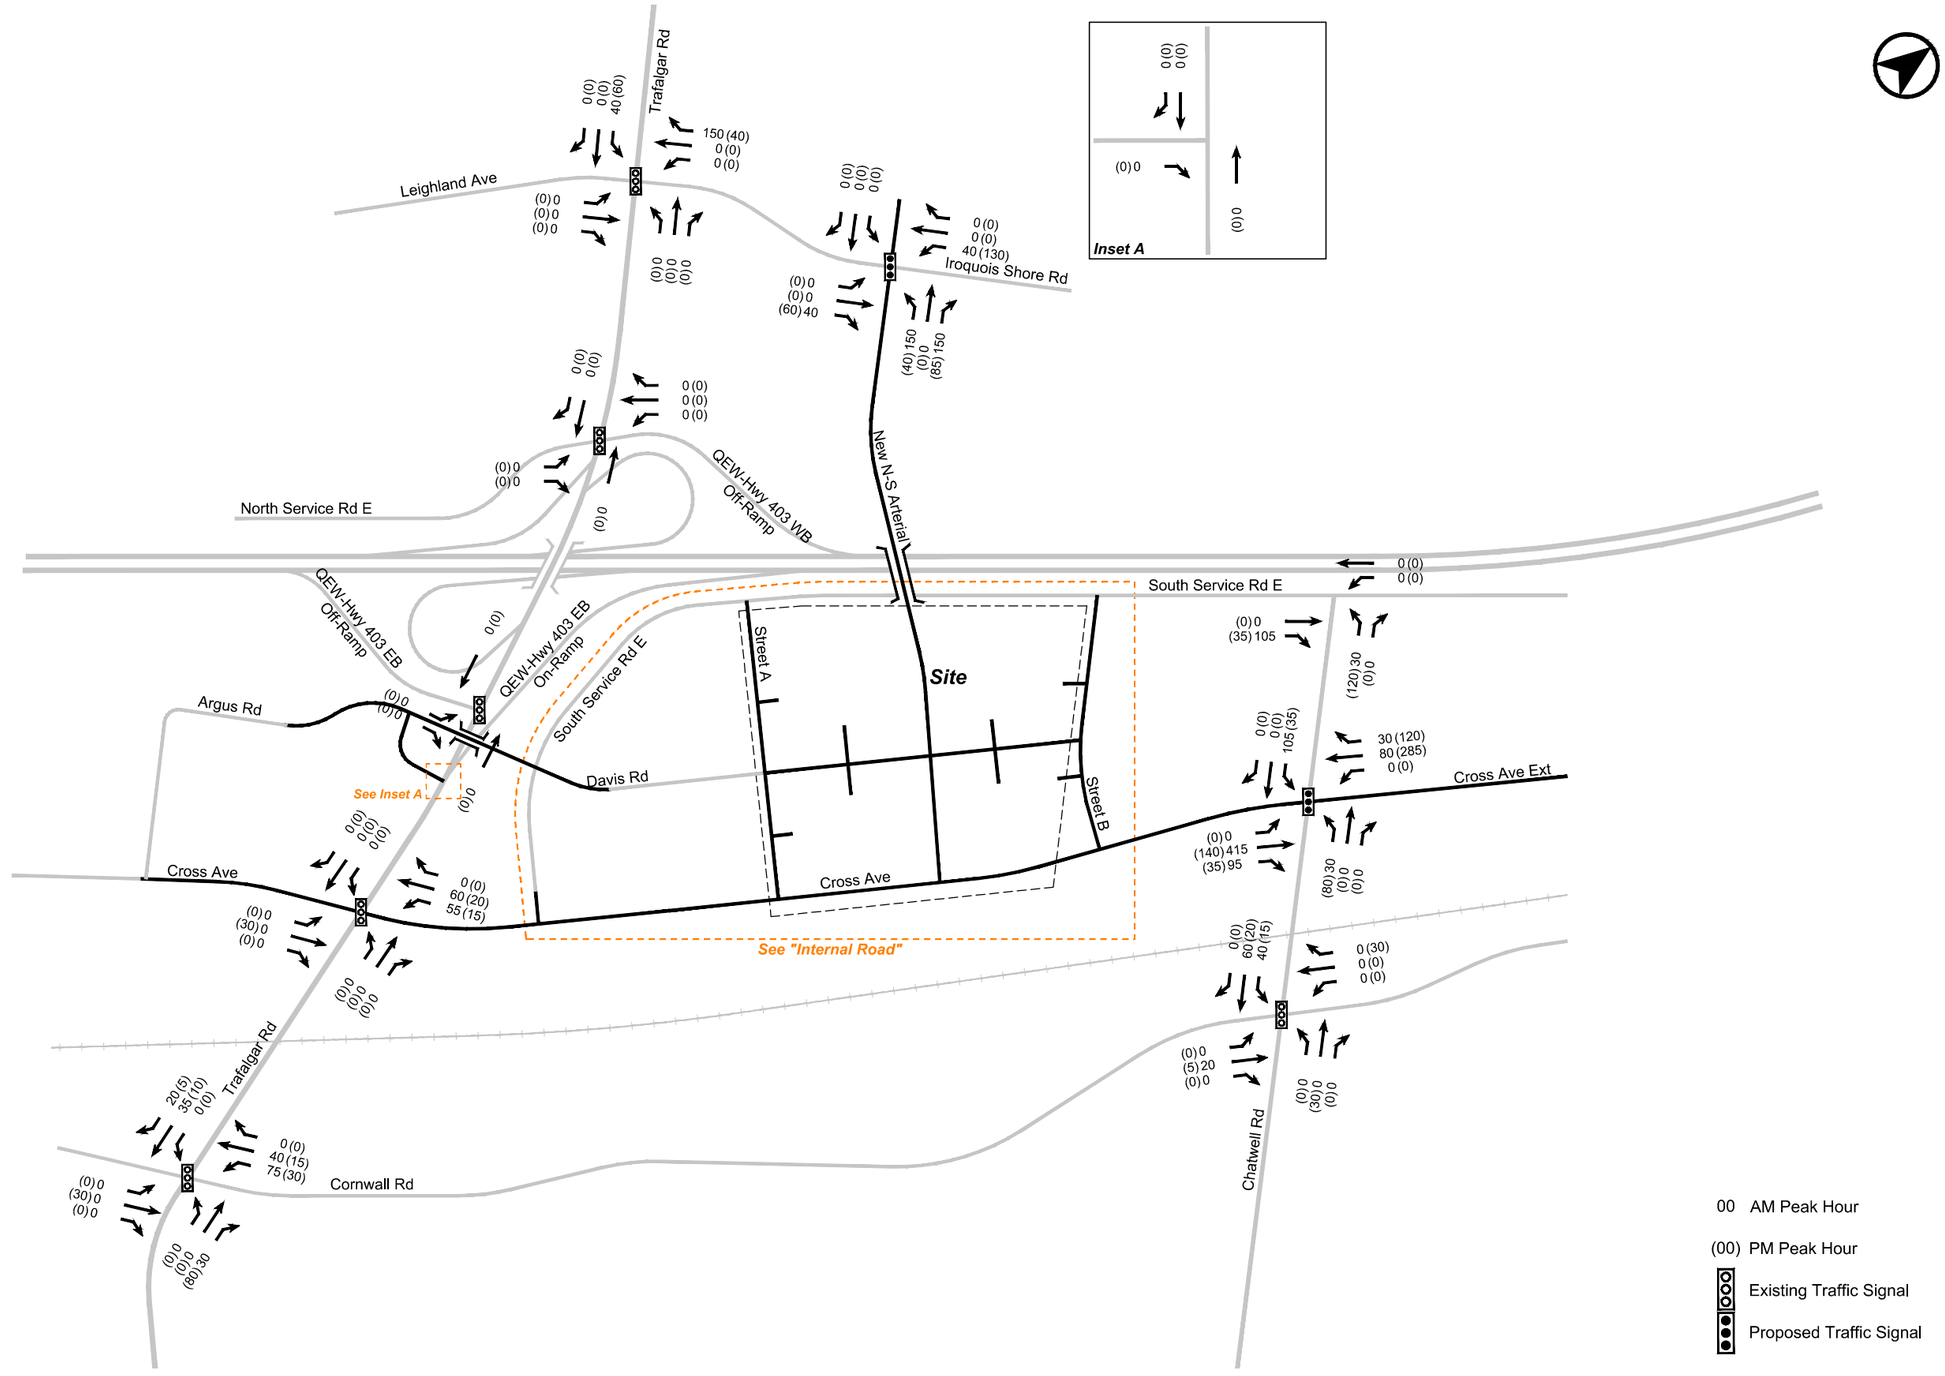


Notes:
1. Based on a review of market-based trips to and from TTS zones 4013-4015, 4017, 4027, 4029 and 4030, for inbound and outbound trips beginning between 6:00 a.m. – 5:59 p.m.

11.5 Future Total Traffic Volumes

Figure 29 and **Figure 30** illustrate Site traffic volumes distributed onto the study area road network for Phase 1 and full buildout, respectively.

Future total traffic, which represents the sum of future background traffic and Site generated traffic volumes is illustrated in **Figure 31** (Phase 1), **Figure 32** (Phase 1) and **Figure 33** (full buildout), for the 2031, 2036 and 2046 horizons, respectively, without the requested corridor growth.



Future total traffic, which represents the sum of future background traffic and Site generated traffic volumes is illustrated in **Figure 34** (Phase 1), **Figure 35** (Phase 1) and **Figure 36** (full buildout), for the 2031, 2036 and 2046 horizons, respectively, with the requested corridor growth.

12.0 TRAFFIC OPERATIONS ANALYSIS

BA Group's terms of reference for the traffic analysis, dated September 2024, is provided in **Appendix R**. The terms of reference was sent to both the Region of Halton and the Town of Oakville. Comments provided by the Town have also been included in **Appendix R**.

12.1 Phase 1 Overview

For Phase 1 of the Site, the existing road network will have sufficient capacity to accommodate the proposed development. As the area road network approaches capacity, non-local drivers will be replaced by local traffic. The road improvements that are being contemplated for the wider Midtown Oakville area, are not required, nor recommended to be constructed, in order to accommodate the travel demand related to Phase 1. All study area intersections will operate at typical busy urban conditions and do not require additional mitigation measures, with the exception of traffic signal timing optimization at noted locations.

12.2 Full Buildout Overview

Under future conditions, with the full build-out of the Midtown Oakville area, the road network will continue to operate under very busy conditions, with some intersections operating at near their theoretical capacity. This is reflective of a busy urban centre, where the majority of mobility needs will be met by non-auto modes of travel.

Beyond the significant road and transit improvements that are already planned and invested in for the Midtown Oakville area, no further improvements are recommended to accommodate the Site at its full buildout program. The improved transit service and availability of alternative routes via new travel corridors in the area are expected to be sufficient in mitigating congestion and high delays while non-local drivers in the area will be discouraged from passing through Midtown Oakville as the area approaches capacity.

The Site's Transportation Demand Management (TDM) Plan also seeks to encourage travel by non-auto modes, while the Site's proximity to frequent higher-order transit, including GO, the future Trafalgar BRT and other bus services operated by Oakville Transit, will allow residents, employees and visitors of the Site to access local and Regional destinations without the use of a car.

A number of trends will shape future mobility in and around the Site, and in the Town of Oakville more broadly, including the following:

- **Many residents who choose to live in Midtown Oakville will do so because of its proximity to transit and the ability to live and work without the daily use of a car. Midtown Oakville is intentionally planned to be a transit-oriented community that is characterized by higher density than the rest of Oakville.** Options to travel to / from Midtown Oakville by car will be limited, given that the existing and future road network will operate under very busy conditions and the on-site parking supply will be limited. Future residents who choose to live in Midtown Oakville will do so because of the variety of mobility connections that will be available to them, in particular the GO line, the Trafalgar BRT and other bus services, that will enable them to meet their day-to-day needs without needing to use a car.
- **Travel modes in Halton Region and the rest of the GTHA are evolving and auto use is decreasing over time, particularly true for peak period travel**. This change is partly occurring in response to increasing congestion caused by population and employment growth in the GTHA. This change is being supported by ongoing municipal and provincial efforts to promote non-auto travel modes, including

improvements to transit service, the expansion of safe cycling and walking infrastructure, the creation of more mixed-use communities that allow people to meet their daily needs locally and the increased availability of first and last mile travel options, including e-bikes and bike share (currently not in Oakville).

This decrease in auto use, particularly in the peak periods, is occurring faster in intensification areas and transit-oriented urban nodes like Midtown Oakville, but is also occurring in car-centric areas of the Region. This is borne out through data collected by the 5-yearly TTS, the latest available of which is the 2022 TTS[3].

- **Work commute habits are also changing, as a result of continued work-from-home initiatives**. Even with some employees returning to the office, an increased proportion of the population now works remotely for some or all of their employment. This results in the reduced need to travel during peak periods, reducing overall trip rates for all modes and reducing the relative peak period impact of new development.
- **An increasing number of daily needs are being met through e-commerce**. This includes on-line shopping, grocery online shopping, food / restaurant deliveries and delivery services, etc. This decreases the need to travel but increases delivery vehicle trips. This results in the need to provide appropriately sized and well-designed pick-up / drop-off and temporary lay-by areas for delivery services.
- **Midtown Oakville is a designated Urban Growth Centre and is intended to be a focus of population and employment growth in the Town of Oakville**. Midtown Oakville is identified in Provincial, Regional and Town policy as a place for intensification. A significant portion of the population and employment growth that is designated for Oakville is intended to be accommodated in Midtown Oakville. The area has some of the best transit access in Oakville, and underutilized or vacant land available for redevelopment. The area is a designated Protected Major Transit Station Area (PMTSA) and a designated Primary Growth Area and Urban Growth Centre[4] that is expected to accommodate the highest level of intensification in the Town. As a result, the traffic impact of growth in the Town will be more concentrated in and around Midtown Oakville. At the same time, growth in the MTSA will have a relatively lower traffic impact, on a per-unit basis, than growth in other less transit-accessible areas of the Town.
- **The proposed development will have minor traffic impacts on movements that are at capacity, on the future area road network.** The intersections that will operate at, or above, their theoretical capacity, will be largely the result of background development traffic and general corridor growth elsewhere in Midtown and the rest of Oakville.
- **The planned introduction of significant new road infrastructure in Midtown Oakville, including through the Site, will help support increased traffic volumes to / from Midtown** and help to better distribute traffic to / from the surrounding road network. Planned infrastructure includes a new overpass over the QEW corridor (New N-S Arterial Street), a new underpass under Trafalgar Road and the Metrolinx / CN rail corridor, QEW interchange improvements and a new network of major and minor streets throughout Midtown. Notably for the Site, this includes a new north-south major street connection

[3] "*Transportation Tomorrow Survey 2022. Travel Summaries for the TTS Area, 1996-2022*". Prepared by Malatest, for the Transportation Information Steering Committee (TISC). July 2025. https://dmg.utoronto.ca/wp-content/uploads/2025/08/2022-TTS-Travel-Summaries-TTS-Area-v5.pdf

[4] "*Livable Oakville Plan (2009 Town of Oakville Official Plan)*". Town of Oakville. Latest consolidated dated August 31, 2021. https://www.oakville.ca/business-development/planning-development/official-plan/livable-oakville-plan/

from Iroquois Shore Road to Cornwall Road that will distribute traffic around the busy Trafalgar Road corridor and a new network of north-south and east-west streets.

The Town of Oakville is currently undertaking a dynamic multi-resolution model that could more accurately reflect the elastic nature of travel routes and travel modes on the area road network. Halton Region maintains a macroscopic EMME travel forecasting model for the entire Region that more dynamically assigns trips to different routes and different modes based on overall network capacity. For example, the EMME model can better reflect route and mode choice elasticity compared to a static model – e.g. people can choose different routes, different modes and different times of travel depending on the travel options that are available and the capacity of the road network. Thus, as the population in the Oakville and in Midtown grows, the model aims to forecast the evolving travel characteristics that would result for the local and regional area. As part of the next steps of the Midtown Oakville planning process, BA Group seeks to collaborate with the Town to understand the inputs and outputs of the Town's modelling work and the changing travel characteristics of the local and regional area as Midtown is built out.

12.3 Capacity Analysis Methodology

The traffic operations analysis has been completed using Synchro Version 11.0, in accordance with the methodologies outlined in the Highway Capacity Manual (HCM) 2000 and Halton Region's Transportation Impact Study Guidelines.

For signalized intersections, the volume-to-capacity ratio (v/c) is an indicator of the capacity utilization for the key movements in the intersections. A v/c of 1.00 indicates that certain governing traffic movements through the key intersections are operating at or near maximum capacity. The primary overall level-of-service (LOS) indicator is delay, both on dividual movements and expressed as an average for all vehicles processed. Many busy urban intersections operate at LOS D to E, which reflects average delays in the range of 35 to 80 seconds.

For unsignalized intersections, level-of-service (LOS) characterizes operational conditions for key movements in terms of delay within the traffic stream. LOS A presents a good level-of-service with short delays, while LOS F represents a poor level-of-service with long delays. The volume-to-capacity ratio is an indicator of the capacity utilization for key movements at the intersection and the resultant residual capacity potential.

The LOS criteria provided by the HCM methodology is summarized as follows:

1. Signalized Intersection LOS
    a. LOS A: Control Delay ≤ 10s
    b. LOS B: 10s < Control Delay ≤ 20s
    c. LOS C: 20s < Control Delay ≤ 35s
    d. LOS D: 35s < Control Delay ≤ 55s
    e. LOS E: 55s < Control Delay ≤ 80s
    f. LOS F: Control Delay > 80s

2. Unsignalized Intersection LOS
    a. LOS A: Control Delay ≤ 10s
    b. LOS B: 10s < Control Delay ≤ 15s
    c. LOS C: 15s < Control Delay ≤ 25s
    d. LOS D: 25s < Control Delay ≤ 35s
    e. LOS E: 35s < Control Delay ≤ 50s

f. LOS F: Control Delay > 50s

All Synchro output sheets, detailing capacity analysis and queuing analysis results for all the study area intersections, are provided in **Appendix Q**.

12.4 Traffic Analysis Parameters

Heavy Vehicle Assumptions

Heavy and medium truck percentages incorporated into the analysis were based upon information provided as part of intersection turning movement counts.

Saturation Flow Assumptions

A base saturation flow of 1,900 passenger cars per hour of green time per lane (pcphgtl) was adopted as the base assumption for the Synchro analysis, that was assumed for all analysis scenarios.

Traffic Signal Timings

Existing traffic signal timings, phasing plans and cycle lengths were obtained from Halton Region. Where necessary, signal timing plans were optimized in future scenarios.

Lost Time Adjustments

For all signalized intersections, a lost-time adjustment (LTA) of -1.0 seconds was applied to all movements. This lost time adjustment provides allowances in the capacity analysis to better account for drivers completing their movements during amber or all-red time (a common occurrence at busy intersections). The lost time adjustment of -1.0 seconds accounts for drivers completing their movements on amber and all-red times. This adjustment is not unreasonable for busy urban transportation networks and was adopted from the City of Toronto's Guidelines for Using Synchro 11, dated January 2024. While modelling standards between municipalities do not always apply, the underlying principle remains applicable for the Oakville area: as the network approaches capacity, more vehicles will make use of the intergreen times to complete their movements. Currently, northbound and southbound through movements along Trafalgar Road are provided with approximately four seconds of amber time. The Synchro model assumes by default that vehicles will advance into the intersection up to 2.5 seconds after the signal turns amber. This results in approximately 1.5 seconds of remaining of amber time, where vehicles will advance into the intersection (i.e. a lost time adjustment of -1.5 seconds). On this basis, an adjustment of -1.0 seconds is appropriate and can be expected to appropriately reflect actual conditions at the intersections.

Peak Hour Factor

For all intersections, peak hour factors (PHF) were calculated based on the existing traffic volume data extracted from the traffic counts utilized in the study. The calculations are provided in **Appendix R**.

Lane Utilization Factors

The default Synchro lane utilization factors (LUF) were adopted, which take into consideration the distribution of individual lane usage within each group.

12.5 Phase 1 (2031) Traffic Operations

12.5.1 Signalized Intersection Operations (2031)

12.5.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

The intersection of Trafalgar Road / Iroquois Shore Road / Leighland Avenue operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 29**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor (especially since each reviewing agency has their own set of criteria for what is deemed "critical"). For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Leighland Avenue movements were evaluated based on Town standards. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.93 and 0.89 during the weekday morning and afternoon peak hours, respectively. These overall v/c are critical under both Town and Region guidelines. The Region's standards also highlight the southbound through movement as critical as it operates at capacity (i.e. v/c of 1.00) in the weekday morning peak hour.

Under all 2031 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2031 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.89 and 0.90 during the weekday morning and afternoon peak hours, respectively. Critical movements were identified as the southbound through movement. With the development of Phase 1 of the Site, the intersection will operate at overall v/c of 0.89 and 0.91 during the weekday morning and afternoon peak hours, respectively, with the southbound through movement continuing under critical conditions.

Given the future character of Midtown Oakville as a transit-oriented context, it is expected that local neighbourhood traffic would begin to displace non-local traffic that is currently encouraged to pass through the area. Study area corridors and QEW-Hwy 403 ramps that were once attractive alternatives to other route options will more likely be avoided due to local traffic taking up more capacity during peak travel periods.

The traffic analysis confirms that this intersection is expected to have some residual vehicle capacity in the 2031 horizon year and confirms that improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate the travel demand related to Phase 1.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.5.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

The intersection of Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 30**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were be evaluated based on Regional standards, while the off-ramp movements were evaluated based on MTO standards.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.85 and 0.83 during the weekday morning and afternoon peak hours, respectively. The overall v/c of 0.85 is critical under both Town and Region guidelines. MTO's standards highlight the westbound right-turn / through movement as critical in the weekday morning peak hour (v/c of 0.79), while the Region's standards highlight both the northbound and southbound through movements as critical in one of the peak hours.

Under all 2031 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2031 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.88 and 0.86 during the weekday morning and afternoon peak hours, respectively. Critical movements include the off-ramp approaches and the northbound and southbound through movements. With the development of Phase 1 of the Site, the intersection will operate at overall v/c of 0.89 and 0.89 during the weekday morning and afternoon peak hours, respectively. Site-related impacts on the critical movements are minimal, and Site drivers are afforded the alterative of using the Royal Windsor interchange if necessary.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate the travel demand related to Phase 1.

As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

12.5.1.3 Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp

The intersection of Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 31**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while the off-ramp movements were evaluated based on MTO standards.

Under existing conditions, the intersection operates at overall v/c of 0.82 and 0.74 during the weekday morning and afternoon peak hours, respectively. MTO's standards highlight the eastbound off-ramp movements as critical.

Under all 2031 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2031 future background condition, the intersection operates at overall v/c of 0.87 and 0.78 during the weekday morning and afternoon peak hours, respectively. Critical movements continue to be the eastbound off-ramp and southbound through movements. With the development of Phase 1 of the Site, the intersection will operate at overall v/c of 0.88 and 0.81 during the weekday morning and afternoon peak hours, respectively. Site-related impacts on the critical movements are minimal and Site drivers are afforded the alterative of using the Royal Windsor interchange if necessary.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.5.1.4 Trafalgar Road / Cross Avenue / South Service Road East

The intersection of Trafalgar Road / Cross Avenue / South Service Road East operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 32**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Cross Avenue movements were evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.70 and 0.80 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2031 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2031 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.87 and 0.90 during the weekday morning and afternoon peak hours, respectively. The shared southbound movements were identified as critical in both peak hours. With the development of Phase 1 of the Site, the intersection continues operating at increasing busy conditions, with all southbound movements at critical conditions.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.5.1.5 Trafalgar Road / Cornwall Road

The intersection of Trafalgar Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 33**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Cornwall Road movements were evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.75 and 0.74 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2031 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2031 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.84 and 0.88 during the weekday morning and afternoon peak hours, respectively. No critical movements were identified. With the Site development, the intersection continues to operate at busy conditions at overall v/c of 0.86 and 0.89 during the weekday morning and afternoon peak hours, respectively. However, no individual critical movements were identified.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.5.1.6 Chartwell Road / Cornwall Road

The intersection of Chartwell Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 34**.

Under existing conditions, the intersection operates at overall v/c of 0.52 and 0.41 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

In the 2031 future background condition, the intersection is expected to operate at overall v/c of 0.55 and 0.44 during the weekday morning and afternoon peak hours, respectively. With the development of Phase 1 of the Site, the intersection is expected to operate at overall v/c of 0.55 and 0.45 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

12.5.1.7 QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East

The intersection of QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East operates under traffic signal control. The traffic operations results under the 2031 horizon year are provided in **Table 35**. At the ultimate horizon, this intersection will be reconfigured into a full interchange.

Under existing conditions, the intersection operates at overall v/c of 0.33 and 0.35 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

In the 2031 future background condition, the intersection is expected to operate at overall v/c of 0.33 and 0.36 during the weekday morning and afternoon peak hours, respectively. With the development of Phase 1 of the Site, the intersection is expected to operate at overall v/c of 0.33 and 0.36 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

12.5.2 Unsignalized Intersection Operations (2031)

The traffic operations results of all unsignalized intersections including Site driveways are provided in **Table 36**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor.

Under all conditions, the unsignalized intersections operate at acceptable LOS at LOS D or better in both weekday peak hours. All site driveways operate well at LOS B or better.

No improvements are recommended as no critical movements were identified in any condition.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.6 Five-Years Beyond Phase 1 (2036) Traffic Operations

12.6.1 Signalized Intersection Operations (2036)

12.6.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

The intersection of Trafalgar Road / Iroquois Shore Road / Leighland Avenue operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 37**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor (especially since each reviewing agency has their own set of criteria for what is deemed "critical"). For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Leighland Avenue movements was evaluated based on Town standards. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.93 and 0.89 during the weekday morning and afternoon peak hours, respectively. These overall v/c are critical under both Town and Region guidelines. The Region's standards also highlight the southbound through movement as critical as it operates at capacity (i.e. v/c of 1.00) in the weekday morning peak hour.

Under all 2036 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2036 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.89 and 0.90 during the weekday morning and afternoon peak hours, respectively. Critical movements were identified as the southbound through movement. With the development of Phase 1 of the Site, the intersection will operate at overall v/c of 0.89 and 0.91 during the weekday morning and afternoon peak hours, respectively, with the southbound through movement continuing under critical conditions.

Given the future character of Midtown Oakville as a transit-oriented context, it is expected that local neighbourhood traffic would begin to displace non-local traffic that is currently encouraged to pass through the area. Study area corridors and QEW-Hwy 403 ramps that were once attractive alternatives to other route options will more likely be avoided due to local traffic taking up more capacity during peak travel periods.

The traffic analysis confirms that this intersection is expected to have some residual vehicle capacity in the 2036 horizon year and confirms that improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate the travel demand related to Phase 1.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.6.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

The intersection of Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 38**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while the off-ramp movements were evaluated based on MTO standards.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.85 and 0.83 during the weekday morning and afternoon peak hours, respectively. The overall v/c of 0.85 is critical under both Town and Region guidelines. MTO's standards highlight the westbound right-turn / through movement as critical in the weekday morning peak hour (v/c of 0.79) while the Region's standards highlight both the northbound and southbound through movements as critical in one of the peak hours.

Under all 2036 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecasted travel demand at the intersection.

With these changes, in the 2036 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.88 and 0.86 during the weekday morning and afternoon peak hours, respectively. Critical movements include the off-ramp approaches and the northbound and southbound through movements. With the development of Phase 1 of the Site, the intersection will operate at overall v/c of 0.89 and 0.89 during the weekday morning and afternoon peak hours, respectively. Site-related impacts on the critical movements are minimal, and Site drivers are afforded the alterative of using the Royal Windsor interchange if necessary.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.6.1.3 Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp

The intersection of Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 39**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements will be evaluated based on Regional standards, while the off-ramp movements are evaluated based on MTO standards.

Under existing conditions, the intersection operates at overall v/c of 0.82 and 0.74 during the weekday morning and afternoon peak hours, respectively. MTO's standards highlight the eastbound off-ramp movements as critical.

Under all 2036 future conditions and in both peak hours, signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2036 future background condition, the intersection operates at overall v/c of 0.87 and 0.78 during the weekday morning and afternoon peak hours, respectively. Critical movements continue to be the eastbound off-ramp and southbound through movements. With the added development of the Site, the intersection will operate at overall v/c of 0.88 and 0.81 during the weekday morning and afternoon peak hours, respectively. Site-related impacts on the critical movements are minimal and Site drivers are afforded the alterative of using the Royal Windsor interchange if necessary.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.6.1.4 Trafalgar Road / Cross Avenue / South Service Road East

The intersection of Trafalgar Road / Cross Avenue / South Service Road East operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 40**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements will be evaluated based on Regional standards, while Cross Avenue movements are evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.70 and 0.80 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2036 future conditions and in both peak hours, signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2036 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.87 and 0.90 during the weekday morning and afternoon peak hours, respectively. The shared southbound movements were identified as critical in both peak hours. With the development of Phase 1 of the Site, the intersection continues operating at increasing busy conditions, with all southbound movements at critical conditions.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.6.1.5 Trafalgar Road / Cornwall Road

The intersection of Trafalgar Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 41**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements will be evaluated based on Regional standards, while Cornwall Road movements are evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.75 and 0.74 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2036 future conditions and in both peak hours, signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2036 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.84 and 0.88 during the weekday morning and afternoon peak hours, respectively. No critical movements were identified. With the Site development, the intersection continues to operate at busy conditions at overall v/c of 0.86 and 0.89 during the weekday morning and afternoon peak hours, respectively. However, no individual critical movements were identified.

Based on the results of the traffic analysis, improvements are not required at this location, with the exception of traffic signal timing optimization, in order to accommodate Phase 1. As the area road network continues to approach capacity, non-local drivers will be replaced by local traffic.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate the travel demand of Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

12.6.1.6 Chartwell Road / Cornwall Road

The intersection of Chartwell Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 42**.

Under existing conditions, the intersection operates at overall v/c of 0.52 and 0.41 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

In the 2036 future background condition, the intersection is expected to operate at overall v/c of 0.55 and 0.44 during the weekday morning and afternoon peak hours, respectively. With the development of Phase 1 of the Site, the intersection is expected to operate at overall v/c of 0.55 and 0.45 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

12.6.1.7 QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East

The intersection of QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East operates under traffic signal control. The traffic operations results under the 2036 horizon year are provided in **Table 43**. At the ultimate horizon, this intersection will be reconfigured into a full interchange.

Under existing conditions, the intersection operates at overall v/c of 0.33 and 0.35 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

In the 2036 future background condition, the intersection is expected to operate at overall v/c of 0.33 and 0.36 during the weekday morning and afternoon peak hours, respectively. With the development of Phase 1 of the Site, the intersection is expected to operate at overall v/c of 0.33 and 0.36 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

12.6.2 Unsignalized Intersection Operations (2036)

The traffic operations results of all unsignalized intersections including Site driveways are provided in **Table 44**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor.

Under all conditions, the unsignalized intersections operate at acceptable LOS at LOS D or better in both weekday peak hours. All site driveways operate well at LOS B or better.

No improvements are recommended as no critical movements were identified in any condition.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7 Full Buildout (2046) Traffic Operations

12.7.1 Signalized Intersection Operations (2046)

12.7.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

The intersection of Trafalgar Road / Iroquois Shore Road / Leighland Avenue operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 45**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Leighland Avenue movements were evaluated based on Town standards. Traffic analysis for conditions with adopted corridor growth as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, are not expected to be realized.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.93 and 0.89 during the weekday morning and afternoon peak hours, respectively. These overall v/c are critical under both Town and Region guidelines. The Region's standards also highlight the southbound through movement as critical as it operates at capacity (i.e. v/c of 1.00) in the weekday morning peak hour.

Under all 2046 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2046 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.89 and 0.90 during the weekday morning and afternoon peak hours, respectively. With the added development of the Site, the intersection will operate at overall v/c of 0.89 and 0.93 during the weekday morning and afternoon peak hours, respectively. Critical movements were identified as the northbound through, southbound left turn and southbound through movements.

Despite the critical movements identified at the intersection, given the future character of Midtown Oakville as a transit-oriented context, it is expected that local neighbourhood traffic would begin to displace non-local traffic that is currently encouraged to pass through the area. Study area corridors and QEW-Hwy 403 ramps that were once attractive alternatives to other route options will more likely be avoided due to local traffic taking up more capacity during peak travel periods. The significant road and transit improvements planned for the area and the anticipated travel demand shifts that are external to the study area, warrant that no further improvements, with the exception of traffic signal timing optimization, should be recommended at this time. The traffic analysis confirms that this intersection is expected to have some residual vehicle capacity, even in the 2046 horizon year.

To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements are not being recommended at this location. This recommendation will be revisited with the subsequent applications for each phase of the development (as was done for Phase 1 in this report).

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

The intersection of Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 46**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while the off-ramp movements were evaluated based on MTO standards.

Under existing conditions, the intersection operates at near-capacity conditions at overall v/c of 0.85 and 0.83 during the weekday morning and afternoon peak hours, respectively. The overall v/c of 0.85 is critical under both Town and Region guidelines. MTO's standards highlight the westbound right-turn/ through movement as critical in the weekday morning peak hour (v/c of 0.79) while the Region's standards highlight both the northbound and southbound through movements as critical in one of the peak hours.

Under all 2046 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2046 future background condition, the intersection continues to operate at near-capacity conditions at overall v/c of 0.87 and 0.86 during the weekday morning and afternoon peak hours, respectively. With the added development of the Site, the intersection will operate at overall v/c of 0.87 and 0.86 during the weekday morning and afternoon peak hours, respectively. Critical movements continue to be the westbound right turn, northbound through and southbound through movements. Site-related impacts on the critical movements are negligible given that Site drivers are expected to use the new Royal Windsor interchange due to proximity and pre-existing congestion issues caused by background growth in the area.

As previously discussed, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements are not being recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity, even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report).

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.3 Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp

The intersection of Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 47**. Highlighted values in the table represent critical movements based upon Region, Town and MTO guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements will be evaluated based on Regional standards, while the off-ramp movements are evaluated based on MTO standards.

Under existing conditions, the intersection operates at overall v/c of 0.82 and 0.74 during the weekday morning and afternoon peak hours, respectively. MTO's standards highlight the eastbound off-ramp movements as critical.

Under all 2046 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2046 future background condition, the intersection operates at near-capacity conditions at overall v/c of 0.94 and 0.85 during the weekday morning and afternoon peak hours, respectively. With the added development of the Site, the intersection will operate at overall v/c of 0.94 and 0.85 during the weekday morning and afternoon peak hours, respectively. Critical movements continue to be the eastbound off-ramp movements. Site-related impacts on the critical movements are negligible given that Site drivers are expected to use the new Royal Windsor interchange due to proximity and pre-existing congestion issues caused by background growth in the area.

As previously discussed, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity, even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report).

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.4 Trafalgar Road / Cross Avenue / South Service Road East

The intersection of Trafalgar Road / Cross Avenue / South Service Road East operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 48**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Cross Avenue movements were evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.70 and 0.80 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2046 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2046 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.91 during the weekday morning peak hours. In the weekday afternoon peak hour, the northbound left turn and southbound through-right movements are forecast to operate over capacity and were identified as critical. With the development of the Site, the intersection continues operating at increasing busy conditions, with the same critical movements. It is noteworthy that Site-related impact on these two critical movements is negligible.

As previously discussed, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements are not being recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity, even in the 2046 horizon year. For movements that are over capacity such as the northbound left turn and southbound through-right movements, non-local drivers in the area can make use of alternative routes or travel modes should be congestion and delays. Site impact is negligible on these movements. No further improvements, with the exception of traffic signal timing optimization are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report).

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.5 Trafalgar Road / Cornwall Road

The intersection of Trafalgar Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 49**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor. For example, Trafalgar Road approach movements were evaluated based on Regional standards, while Cornwall Road movements were evaluated based on Town standards.

Under existing conditions, the intersection operates at overall v/c of 0.75 and 0.74 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Under all 2046 future conditions and in both peak hours, traffic signal timings are proposed to be optimized to better serve forecast travel demand at the intersection.

With these changes, in the 2046 future background condition, the intersection is expected to operate at near-capacity conditions at overall v/c of 0.88 and 0.90 during the weekday morning and afternoon peak hours, respectively. The southbound through movements are close to critical conditions at v/c of 0.84 in both peak hours. With the development of the Site, the southbound through movement operates at v/c of 0.85.

As previously discussed, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements are not being recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity, even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report).

12.7.1.6 Chartwell Road / Cornwall Road

The intersection of Chartwell Road / Cornwall Road operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 50**.

Under existing conditions, the intersection operates at overall v/c of 0.52 and 0.41 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

In the 2046 future background condition, the intersection is expected to operate at overall v/c of 0.57 and 0.47 during the weekday morning and afternoon peak hours, respectively. With the development of the Site, the intersection is expected to operate at overall v/c of 0.59 and 0.48 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

12.7.1.7 QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East

The intersection of QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East operates under traffic signal control. The traffic operations results under the 2046 horizon year are provided in **Table 51**. At the ultimate horizon, this intersection will be reconfigured into a full interchange.

Under existing conditions, the intersection operates at overall v/c of 0.33 and 0.35 during the weekday morning and afternoon peak hours, respectively. No critical movements are highlighted under existing conditions.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.8 South Service Road East / Davis Road / Argus Road Extension

The intersection of South Service Road East / Davis Road currently operates under stop control. By the 2046 horizon with the Argus Road extension, the intersection will operate under signalized conditions. The traffic operations results under the 2046 horizon year are provided in **Table 52**.

In the 2046 future background condition, the intersection is expected to operate at overall v/c of 0.23 and 0.38 during the weekday morning and afternoon peak hours, respectively. With the development of the Site, the intersection is expected to operate at overall v/c of 0.31 and 0.39 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. The intersection currently does not have the Argus Road extension, and operates under stop control. By the 2046 horizon year, the intersection will be reconfigured into signalized operations with a west leg.
5. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.1.9 New N-S Arterial Street / Davis Road

The planned intersection of the New N-S Arterial Street / Davis Road will operate under signalized control. An additional scenario was tested considering the future Bus Rapid Transit lanes (as outer lanes) along the New N-S Arterial Street. The traffic operations results under the 2046 horizon year are provided in **Table 53** and **Table 54**, under the base configuration and the configuration with the BRT lanes, respectively.

Base Configuration

In the 2046 future background condition, the intersection is expected to operate at overall v/c of 0.16 and 0.05 during the weekday morning and afternoon peak hours, respectively. With the development of the Site, the intersection is expected to operate at overall v/c of 0.29 and 0.16 during the weekday morning and afternoon peak hours, respectively.

With BRT Configuration

With the construction of the bus rapid transit, the outer lanes are planned to be converted to bus-only lanes. In the 2046 future background condition, the intersection is expected to operate at overall v/c of 0.23 and 0.07 during the weekday morning and afternoon peak hours, respectively. With the development of the Site, the intersection is expected to operate at overall v/c of 0.39 and 0.15 during the weekday morning and afternoon peak hours, respectively.

No improvements are recommended as no critical movements were identified in any condition.

4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

12.7.2 Unsignalized Intersection Operations (2046)

The traffic operations results of all unsignalized intersections including Site driveways are provided in **Table 58**. Highlighted values in the table represent critical movements based upon Halton Region and Town of Oakville guidelines, depending on the applicable jurisdiction for each corridor.

Under all conditions, the unsignalized intersections operate at acceptable LOS at LOS D or better in both weekday peak hours. All site driveways operate well at LOS B or better.

No improvements are recommended as no critical movements were identified in any condition.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All delays are in seconds (s).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Traffic analysis for conditions with adopted corridor growth, as per the Town and MTO request, are also provided for reference purposes, but as previously discussed in **Section 11.3.2**, this corridor growth is not expected to be realized.

13.0 QUEUING ASSESSMENT

A queuing assessment for each of the study area intersections, for each traffic analysis scenario, is provided in the following sections.

13.1 Phase 1 (2031) Queuing

13.1.1 Signalized Intersection Queuing (2031)

13.1.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

Queuing results at the Trafalgar Road / Iroquois Shore Road / Leighland Avenue intersection are summarized in **Table 59**.

Under existing conditions, the westbound right turn and northbound right-turn queues exceed existing storage lengths by up to 5 and 4 car lengths, respectively (in Synchro, every 7.6m represents one car-length including headways). These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed existing storage lengths and exceed storage by up to 5 car-lengths. Site-related impact on these movements is negligible. With the Site development, the same two movements continue to exceed storage lengths by up to 5 car lengths. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

SBR	70	0 (0)	0 (3.1)	0 (0)	0 (3)	0 (0)	0 (3)	0 (0)	0 (3)	0 (0)	0 (3)

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.1.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

Queuing results at the Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp intersection are summarized in **Table 60**.

Under existing conditions, the northbound and southbound through queues exceed existing storage lengths by up to 7 and 16 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the southbound through queues continue to exceed storage lengths by up to 19 car lengths. Additionally, the westbound right-turn queue exceeds storage by up to 2 car lengths. Site-related impact once the Site is built out is negligible, especially since there is the option to use the future full Royal Windsor interchange. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.1.1.3 Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp

Queuing results at the Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp intersection are summarized in **Table 61**.

Under existing conditions, the eastbound right-turn queues exceed existing storage lengths by up to 2 car lengths. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, with the traffic signal timing optimization, queues can be contained within provided storage lengths. With the Site development, queues continue to be contained within provided storage lengths.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.1.1.4 Trafalgar Road / Cross Avenue / South Service Road East

Queuing results at the Trafalgar Road / Cross Avenue / South Service Road East intersection are summarized in **Table 62**.

Under existing conditions, the eastbound left and southbound through movements exceed existing storage lengths by up to 2 and 18 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed storage lengths by up to 9 and 22 car lengths, respectively. Site-related impact once the Site is built out is negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.1.1.5 Trafalgar Road / Cornwall Road

Queuing results at the Trafalgar Road / Cornwall Road intersection are summarized in **Table 63**.

Under existing conditions, the eastbound left, westbound right and northbound through queues exceed existing storage lengths by up to 11, 3 and 8 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the eastbound left, westbound right and northbound through queues exceed existing storage lengths by up to 12, 14 and 8 car lengths, respectively. The westbound through exceeds storage by up to 1 car length. With the Site development, Site-related impact on these critical movements are negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.1.1.7 QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East

Queuing results at the QEW Hwy 403 Ramps / Royal Windsor Drive / South Service Road East intersection are summarized in **Table 65**.

Under existing conditions, the northbound left turn queues exceed existing storage lengths by up to 1 car length. These queue spillbacks are currently stored within adjacent through lanes.

Under future background conditions, the northbound left turn queues continue to exceed existing storage lengths by up to 1 car length. Site-related impact once the Site is built out is minimal. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions. The intersection offers an alternative access point to the QEW-Hwy 403 at the Trafalgar ramps.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2 Five-Years Beyond Phase 1 (2036) Queuing

13.2.1 Signalized Intersection Queuing (2036)

13.2.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

Queuing results at the Trafalgar Road / Iroquois Shore Road / Leighland Avenue intersection are summarized in **Table 67**.

Under existing conditions, the westbound right turn and northbound right-turn queues exceed existing storage lengths by up to 5 and 4 car lengths, respectively (in Synchro, every 7.6m represents one car length including headways). These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed existing storage lengths and exceed storage by up to 5 car lengths. Site-related impact on these movements is negligible. With the Site development, the same two movements continue to exceed storage lengths by up to 5 car lengths. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

Queuing results at the Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp intersection are summarized in **Table 68**.

Under existing conditions, the northbound and southbound through queues exceed existing storage lengths by up to 7 and 16 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the southbound through queues continue to exceed storage lengths by up to 19 car lengths. Additionally, the westbound right-turn queue exceeds storage by up to 2 car lengths. Site-related impact once the Site is built out is negligible, especially since there is the option to use the future full Royal Windsor interchange. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.3 Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp

Queuing results at the Trafalgar Road / QEW-Hwy 403 Eastbound Off-Ramp intersection are summarized in **Table 69**.

Under existing conditions, the eastbound right-turn queues exceed existing storage lengths by up to 2 car lengths. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, with the traffic signal timing optimization, queues can be contained within provided storage lengths. With the Site development, queues continue to be contained within provided storage lengths.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.4 Trafalgar Road / Cross Avenue / South Service Road East

Queuing results at the Trafalgar Road / Cross Avenue / South Service Road East intersection are summarized in **Table 70**.

Under existing conditions, the eastbound left and southbound through movements exceed existing storage lengths by up to 2 and 18 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed storage lengths by up to 9 and 22 car lengths, respectively. Site-related impact once the Site is built out is negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.5 Trafalgar Road / Cornwall Road

Queuing results at the Trafalgar Road / Cornwall Road intersection are summarized in **Table 71**.

Under existing conditions, the eastbound left, westbound right and northbound through queues exceed existing storage lengths by up to 11, 3 and 8 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the eastbound left, westbound right and northbound through queues exceed existing storage lengths by up to 12, 14 and 8 car lengths, respectively. The westbound through exceeds storage by up to 1 car-length. With the Site development, Site-related impact on these critical movements are negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.

2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.6 Chartwell Road / Cornwall Road

Queuing results at the Chartwell Road / Cornwall Road intersection are summarized in **Table 72**.

Under existing conditions, the northbound left turn queues exceed existing storage lengths by up to 4 car lengths. These queue spillbacks are currently stored within adjacent through lanes.

Under future background conditions, the northbound left turn queues continue to exceed existing storage lengths by up to 4 car lengths. Site-related impact once the Site is built out is negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.2.1.7 QEW-Hwy 403 Ramps / Royal Windsor Drive / South Service Road East

Queuing results at the QEW Hwy 403 Ramps / Royal Windsor Drive / South Service Road East intersection are summarized in **Table 73**.

Under existing conditions, the northbound left-turn queues exceed existing storage lengths by up to 1 car length. These queue spillbacks are currently stored within adjacent through lanes.

Under future background conditions, the northbound left-turn queues continue to exceed existing storage lengths by up to 1 car length. Site-related impact once the Site is built out is minimal. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions. The intersection offers an alternative access point to the QEW-Hwy 403 at the Trafalgar ramps.

As under existing conditions, any queue spillbacks are currently being accommodated within adjacent through lanes. This behaviour is expected to continue under future conditions. To align with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, road improvements are not being recommended at this intersection, in order to accommodate Phase 1. This recommendation will however be revisited with the subsequent applications for each phase of the development.

13.2.2 Unsignalized Intersection Queuing (2036)

Queuing results at the unsignalized intersections, including Site driveways, are summarized in **Table 74**.

Under all future conditions, queues are expected to be contained within provided storage lengths.

13.3 Full Buildout (2046) Queuing

13.3.1 Signalized Intersection Queuing (2046)

13.3.1.1 Trafalgar Road / Iroquois Shore Road / Leighland Avenue

Queuing results at the Trafalgar Road / Iroquois Shore Road / Leighland Avenue intersection are summarized in **Table 75**.

Under existing conditions, the westbound right-turn and northbound right-turn queues exceed existing storage lengths by up to 5 and 4 car lengths, respectively (in Synchro, every 7.6m represents one car length including headways). These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed existing storage lengths and exceed storage by up to 6 car lengths. With the Site development, the same two movements continue to exceed storage lengths. The westbound right turn exceeds storage by up to 11 car lengths. Additionally, the southbound left turn also begins to exceed storage by up to 5 car lengths. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

Despite the critical movements identified from the queuing review, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report). Queuing conditions at this intersection will be monitored in as development progresses.

Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.3.1.2 Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp

Queuing results at the Trafalgar Road / North Service Road East / QEW-Hwy 403 Westbound Off-Ramp intersection are summarized in **Table 76**.

Under existing conditions, the northbound and southbound through queues exceed existing storage lengths by up to 7 and 16 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the southbound through queues continue to exceed storage lengths by up to 18 car lengths. Additionally, the westbound right turn queue exceeds storage by up to 2 car lengths. Site-related impact once the Site is built out is negligible, especially since there is the option to use the future full Royal Windsor interchange. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As previously mentioned, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report). Queuing conditions at this intersection will be monitored in as development progresses.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).
3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.3.1.4 Trafalgar Road / Cross Avenue / South Service Road East

Queuing results at the Trafalgar Road / Cross Avenue / South Service Road East intersection are summarized in **Table 78**.

Under existing conditions, the eastbound left and westbound right-turn queues exceed existing storage lengths by up to 2 and 3 car lengths, respectively. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the same two movements continue to exceed storage lengths by up to 8 car lengths (the eastbound left turn). Site-related impact once the Site is built out is negligible, since Site drivers will not use this movement. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As previously mentioned, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity, even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report). Queuing conditions at this intersection will be monitored in as development progresses.

For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.

13.3.1.5 Trafalgar Road / Cornwall Road

Queuing results at the Trafalgar Road / Cornwall Road intersection are summarized in **Table 79**.

Under existing conditions, the westbound right-turn queues exceed existing storage lengths by up to 1 car length. These queue spillbacks are currently stored within adjacent through lanes.

Under future conditions, traffic signal timings were optimized to better serve travel demand at the intersection.

Under future background conditions, the westbound right turn exceeds storage lengths by up to 12 car lengths. The westbound through exceeds its storage length by 2 car lengths. Site-related impact once the Site is built out is negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As previously mentioned, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report). Queuing conditions at this intersection will be monitored in as development progresses.

13.3.1.6 Chartwell Road / Cornwall Road

Queuing results at the Chartwell Road / Cornwall Road intersection are summarized in **Table 80**.

Under existing conditions, the northbound left-turn queues exceed existing storage lengths by up to 4 car lengths. These queue spillbacks are currently stored within adjacent through lanes.

Under future background conditions, the northbound left-turn queues exceed existing storage lengths by up to 5 car lengths. Site-related impact once the Site is built out is negligible. Queue spillbacks continue to be accommodated within adjacent through lanes as under existing conditions.

As previously mentioned, in keeping with the policy and planning initiatives for the Midtown Oakville area that encourage sustainable travel, further road improvements should not be recommended at this location. Significant road and transit improvements are already planned for the area that result in residual vehicle capacity even in the 2046 horizon year. No further improvements, with the exception of traffic signal timing optimization, are recommended at this time but will be reviewed with the applications for each subsequent phase of the development (as was done for Phase 1 in this report). Queuing conditions at this intersection will be monitored in as development progresses.

Notes:
1. XX (XX) – Weekday Morning (Weekday Afternoon) Peak Hours.
2. All storage lengths and queues are in metres (m).

3. Highlighted values in the table above represent critical movements based upon Halton Region, Town of Oakville and Ministry of Transportation Ontario guidelines, depending on the applicable jurisdiction for each corridor.
4. Storage lengths are measured based on existing conditions from Google aerial view where appropriate. For future intersection movements, storage lengths are only estimates and subject to change based on the final design. Where exclusive turn lanes are not provided, storage lengths are measured to the downstream intersection, key travel corridor or rail line. Ramp storage lengths are measured to the bullnose.
5. This is the BRT only travel lane and is not an exclusive right turn lane. However, right turns are permitted to use the BRT lanes to complete their right turn movements if they merge into the bus lanes for a short distance.

13.3.1.10 New N-S Arterial Street / Cross Avenue

Queuing results at the New N-S Arterial Street / Cross Avenue intersection are summarized in **Table 85**.

Under all future conditions, queues are expected to be contained within provided storage lengths.

14.0 SUMMARY & CONCLUSIONS

BA Group has been retained by South Service Holding Corp. (the "**Applicant**") to provide transportation consulting services for a Draft Plan of Subdivision application to permit the redevelopment of 420-468 South Service Road East, in the Town of Oakville (the "**Site**").

An OPA application for the Site was first submitted to the Town of Oakville in November 2024 for a mixed-use master planned community. As part of that application, BA Group prepared a transportation study titled "*420-468 South Service Road East, Proposed Mixed-Use Development, Urban Transportation Considerations*" dated November 2024.

The Site Master Plan was subsequently revised in response to Town, public and other stakeholder comments, and a revised OPA and ZBA application was made to the Town in October 2025. As part of that application, BA Group prepared a report titled "*420-468 South Service Road East, Proposed Mixed-Use Development, Urban Transportation Considerations*" dated October 2025. The Town has since provided comments on the revised application.

On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-073 and Zoning By-law 2026-074 which amended the in-force Liveable Oakville Plan (OPA 83) and the in-force Town of Oakville Zoning By-law 2014-014, respectively. The site-specific bylaws permit residential and mixed uses on the Site, establish maximum heights (38 stories) and densities, establish future public road right-of-way widths, and introduce site-specific requirements on built form, massing, parkland, vehicle parking, bicycle parking and other policies.

The Site Master Plan has since been revised to respond to the requirements of the site-specific zoning bylaws as well as Town comments. A Draft Plan of Subdivision application is now being made to establish the development blocks, public street network and conceptual phasing plan. The transportation elements of the Site Master Plan generally remain the same as the October 2025 application, including the proposed public street network, block structure, open space network, site accesses, internal site circulation, and parking and loading arrangements. A key change, from a traffic impact perspective, is a reduction in maximum tower heights across the Site from 48 stories to 38 stories, which in turn decreases the total development floor area.

As a result of the reduction in the development floor area, the traffic generation of the development will decrease. This report has been updated to reflect the reduced number of residential units and to address all comments provided by the Town, Region and the Ministry Transportation Ontario (MTO).

Key findings of this transportation assessment are summarized below.

Current vs. October 2025 Submission

1. The revised Site Master Plan includes four blocks with a total of 5,600 residential units and 9,118 m^2 GFA of retail. Since the October 2025 submission, the number of residential units has been reduced from 6,945 to 5,600, which represents a 19.4% reduction. The non-residential GFA remains the same.
2. Other key revisions to the master plan from the October 2025 submission include:
    - A reduction in maximum tower heights across the Site from 48 stories to 38 stories;
    - A refinement in the placement of towers and podiums across the development blocks; the tower locations remain generally the same;

- A refinement in the arrangement of the open spaces, while maintaining the overall open space strategy;
- A minor shift in proposed driveway locations on Davis Road to respond to the revised arrangement of buildings and open spaces; and
- Moving the existing GE building in the northwest quadrant of the Site south from the 14m MTO setback and into the Site, and introducing a circular driveway to provide emergency vehicle, pick-up/drop-off and servicing access to the building.

3. Other transportation elements of the Site Master Plan remain the same, including:
    - The overall block structure of the Site, including four development quadrants defined by the new public road network;
    - The alignment, right-of-way and functional design of the new public street network;
    - The proposed site accesses onto the public street network. As discussed above, the locations of the proposed driveways on Davis Road have been slightly shifted to respond to the revised arrangement of buildings and open spaces, but the overall access arrangements remain the same;
    - The internal site circulation including pedestrian circulation, pick-up/drop-off and parking access arrangements;
    - The loading arrangements; and
    - The vehicle and bicycle parking arrangements.

Proposed Public Street Network

4. The development blocks will be framed by a network of east-west and north-south streets including:
    - Street A – A new north-south local street along the western edge of the Site connecting between South Service Road East and Cross Avenue;
    - Street B – A new north-south local street along the eastern edge of the Site connecting between South Service Road East and Cross Avenue;
    - South Service Road – An existing east-west local road along the north edge of the Site;
    - Davis Road – A new east-west collector road through the centre of the Site connecting from west of Trafalgar Road (where it becomes Argus Road) to Street B;
    - Cross Avenue – A new east-west arterial road along the south edge of the Site connecting from west of Trafalgar Road to Chartwell Road east of the Site; and
    - North-South Arterial – A new north-south arterial road through the centre of the Site connecting from Iroquois Shore Road in the north to Cornwall Road in the south. The North-South Arterial road will have an overpass over the QEW to the north of the Site, and an underpass under the Metrolinx/CN rail corridor to the south of the Site.
5. The new public street network will provide access for all modes and generally aligns with the transportation network contained in the Oakville Midtown Official Plan Amendment (the “Midtown OPA”).

6. To better align with the Site's western property boundary and to facilitate the efficient development of the blocks, the following minor changes to the Draft Midtown Oakville OPA street network are being proposed:

    - The Draft Midtown Oakville OPA illustrates a new north-street local street along the western border of the Site that connects between South Service Road East and Davis Road. The development proposal extends this north-south street (proposed as Local Street A) southward from Davis Road to connect to Cross Avenue. The extension of this local road will provide improved connectivity for all modes of travel and better serve the access and circulation needs of the revised development proposal.

    - The north-south local street (Local Street A) on the west side of the Site, is proposed to be shifted slightly further west to align with the western property limits of the Site so that Local Street A is within the Site boundaries.

    - The addition of two active-only crossings of the planned New N-S Arterial street that bypass the QEW-Hwy 403 and the Metrolinx/CN rail corridor. On the north side of the Site (between South Service Road East and Davis Road), the active-only crossing will be in the form of an underpass under the New N-S Arterial Street. Between Davis Road and Cross Avenue, the active-only crossing will be in the form of an overpass over the New N-S Arterial Street.

    - The east-west Collector Street (Davis Road), adjacent to the proposed Block 1 within the Site, will adopt a tangent alignment versus the "curved" alignment illustrated in the Draft Midtown Oakville OPA. This tangent alignment produces a more uniform development block on the north side of Davis Road, that also provides a more regular shape to maximize the efficient massing of buildings.

7. The proposed changes enhance the functionality of the Draft Midtown Oakville OPA transportation network. The remainder of the proposed new street network remains consistent with the Draft Midtown Oakville OPA, including the extension of Davis Road, Cross Avenue through the Site and the New N-S Arterial Street that with an overpass across the QEW-Hwy 403 to the north and a "rail-over-road" underpass across the Metrolinx / CN rail corridor to the south

Vehicle Parking

8. On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-074 which established maximum vehicle parking supply ratios for the Site.

9. The parking supply for each building will be refined and determined at the SPA stage and will fall within the maximum requirements of the zoning bylaw.

Bicycle Parking

10. On July 7, 2026, Town Council adopted site-specific Zoning By-law 2026-074 which established minimum bicycle parking requirements for the Site.

11. The bicycle parking supply for each building will be refined and determined at the SPA stage and will meet the minimum requirements of the zoning bylaw.

Loading Considerations

12. The Town of Oakville's Zoning By-law 2014-014 does not include a requirement for a minimum number of loading spaces.

13. Regardless of the absence of a zoning bylaw requirement, there is a practical requirement for an appropriate loading supply for the Site that reflects the intensification being proposed.

14. The loading facilities for each building, including the design of vehicle manoeuvring' areas, will be refined during the SPA stage. The loading supply strategy will be evaluated against the practical, functional, and policy requirements associated with the various types of loading operations that would be experienced on a daily basis.

Transportation Demand Management

15. A TDM strategy has been developed to ensure that the proposed development sets a sustainable precedent in urban development (e.g. increase vehicle occupancy and reduced vehicle kilometres travelled) and encourages the use of alternative travel modes.

16. TDM measures proposed as part of the development include, but are not limited to:

    - Provision of a reduced resident parking supply;
    - Provision of unbundled parking from unit cost;
    - Provision of convenient pick-up and drop-off facilities within and around the development blocks to facilitate passenger pick-up and drop-off via shared use mobility services, short-term small scale residential deliveries;
    - Consideration to provide car share spaces on the Site;
    - Provision of a bicycle parking supply that meets the Zoning By-law standards and consideration for a range of facility types (i.e. cargo bicycle parking);
    - Consideration to provide bike share stations on the Site;
    - Provision of bicycle repair stations;
    - Consideration to provide private or shared micromobility devices; and;
    - Provision of direct pedestrian and cycling connections to building entrances, bicycle parking facilities, nearby transit stops, and the external / public network.

Transportation Impact Assessment

17. The traffic operations analysis has been undertaken for the weekday morning and afternoon peak hours.

18. Given the future character of Midtown Oakville as a transit-oriented context, it is expected that the currently observed trends of negligible growth along key travel corridors will continue. Declining or negligible growth trends are expected to continue, especially given the rise in local development and densification. As the area approaches capacity into the future, it is expected that local neighbourhood traffic would begin to displace non-local traffic that is currently encouraged to pass through the area. Study area corridors and the QEW-Hwy 403 ramps that were once attractive alternatives to other route options will more likely be avoided, due to local traffic utilizing more capacity during peak travel periods.

19. Future transit infrastructure improvements, such as the Trafalgar Bus Rapid Transit, will cause a necessary shift in existing travel mode choice that would further reduce the reliance on single-occupancy vehicles and congestion and delays in the area. This projection would be consistent with the designation of Midtown Oakville as an “Anchor Mobility Hub” (by Metrolinx) and a “Major Transit Station Area” (by Halton Region). On this basis, it is most likely that corridor growth volumes on key corridors will remain negligible or even decline, as the Midtown Oakville area evolves into the future.

20. As requested by the Town and MTO, the analysis undertaken in this study considered: 1) a base case where the area will not experience corridor growth, in keeping with the designation as a transit-oriented community neighbourhood and 2) a sensitivity case where corridor growth assumptions are included in the analysis of all future horizons.

21. A summary of the traffic analysis scenarios considered for the traffic analysis is as follows:
    - Phase 1 build-out (**2031**):
        - 2031 Base traffic analysis (**without** additional corridor growth)
        - 2031 Sensitivity traffic analysis (**with** additional corridor growth)
    - 5 years beyond build-out of Phase 1 (**2036**):
        - 2036 Base traffic analysis (**without** additional corridor growth)
        - 2036 Sensitivity traffic analysis (**with** additional corridor growth)
    - Ultimate buildout of the entire Site (**2046**) - 20 years from the date of this study:
        - 2046 Base traffic analysis (**without** additional corridor growth)
        - 2046 Sensitivity traffic analysis (**with** additional corridor growth)

22. Phase 1 of the Site is expected to generate **430 and 435 two-way gross vehicle trips** during the morning and afternoon peak hours, respectively. With consideration for internal Site trip interactions, Phase 1 is expected to generate **420 and 405 two-way external vehicle trips**, during the morning and afternoon peak hours, respectively, inclusive of residential and retail trips.

23. The full buildout of the Site is expected to generate **1,425 and 1,575 two-way gross vehicle trips** during the morning and afternoon peak hours, respectively. With consideration for internal Site trip interactions, the Site is expected to generate **1,395 and 1,405 two-way external vehicle trips**, during the morning and afternoon peak hours, respectively, inclusive of residential and retail trips.

Phase 1 Analysis

24. With Phase 1, under future total conditions **without corridor growth**, signalized intersections along Trafalgar Road generally will operate at busy but acceptable conditions in the weekday peak hours, with overall v/c ratios ranging from 0.81 to 0.96. Under future total conditions **with the sustained corridor growth** assumptions requested by the Town and MTO for the relevant corridors, intersections along Trafalgar Road will operate at over-capacity conditions, with overall v/c ratios ranging from 0.99 to 1.17.

25. Under all conditions, the unsignalized intersections operate at acceptable LOS at LOS D or better in both weekday peak hours. All site driveways operate well at LOS B or better.

26. In general, the 95th percentile queues at the study area intersections can be contained without existing storage lanes or adjacent through lanes. For critical movements at study area intersections (where queues exceed storage), Site-related impacts are mostly negligible or minimal on these movements. No further mitigation measures are recommended at this time.

27. For Phase 1 of the Site, the existing road network will have sufficient capacity to accommodate the proposed development. As the area road network approaches capacity, non-local drivers will be replaced by local traffic. The road improvements that are being contemplated for the wider Midtown Oakville area, are not required, nor recommended to be constructed, in order to accommodate the travel demand related to Phase 1. All study area intersections will operate at typical busy urban conditions and do not require additional mitigation measures, with the exception of traffic signal timing optimization at noted locations.

Full Buildout Analysis

28. With the full buildout of the Site, under future total conditions **without corridor growth**, signalized intersections along Trafalgar Road generally will operate at busy but acceptable conditions in the weekday peak hours, with overall v/c ratios ranging from 0.85 to 0.94. Under future total conditions **with the sustained corridor growth** assumptions requested by the Town and MTO for the relevant corridors, intersections along Trafalgar Road will operate at over-capacity conditions, with overall v/c ratios ranging from 1.18 to 1.66.

29. Other study area signalized intersections (including the two future intersections of the New N-S Arterial with Davis Road and Cross Avenue) will operate well at overall v/c of 0.16 to 0.44 in future total conditions.

30. Most unsignalized intersections operate well. **With sustained corridor growth**, the Chartwell Road / South Service Road East intersection will experience high delays for the minor street (northbound) approach.

31. In general, the 95th percentile queues at the study area intersections can be contained without existing storage lanes or adjacent through lanes. For critical movements at study area intersections (where queues exceed storage), Site-related impacts are mostly negligible or minimal on these movements. No further mitigation measures are recommended at this time.

32. With the full build-out of the Midtown Oakville area, the road network will continue to operate under very busy conditions, with some intersections operating at, or above, their theoretical capacity. This is reflective of a busy urban centre where the majority of mobility needs will be met by non-auto means including

transit (particularly GO, BRT and other bus transit) and active modes (walking and cycling and other micro-mobility), while a smaller proportion of travel needs will continue to be met via private automobile.

33. The planned introduction of significant new road infrastructure in Midtown Oakville, including through the Site, will help support increased traffic volumes to / from Midtown and help to better distribute traffic to / from the surrounding road network.

34. The Site's TDM Plan seeks to encourage and enable travel by non-auto means, while accommodating the smaller proportion of people that own and use a private automobile. TDM strategies that encourage non-auto travel include limiting the Site's parking supply, provision of high-quality bicycle parking, a full suite of TDM measures and the creation of a dense, mixed-use and walkable community within the Site and Midtown Oakville. Most importantly, the Site's proximity to frequent higher-order transit, including GO, the future Trafalgar BRT and other bus services operated by Oakville Transit, will allow residents, employees and visitors of the Site to access local and regional destinations without use of a car.

The proposed development is appropriate and can be accommodated on the future area road network, in consideration of the future transit of Midtown Oakville, the upgraded road network planned in the area and the transit and active oriented nature of the proposed TDM Plan.

RE: 420-468 SOUTH SERVICE ROAD – PROPOSED TRAFFIC ANALYSIS TERMS OF REFERENCE

BA Group has been retained by The Rose Corporation to provide transportation consulting services in support of an Official Plan Amendment (OPA) being made to the Town of Oakville for a proposed mixed-use development to be located at the lands municipally known as 420-268 South Service Road East (herein referred to as "the site"), in the southeast quadrant of the Queen Elizabeth Way (QEW) / Trafalgar Road. The 27.3 acre site is a roughly rectangular parcel bounded by the QEW to the north, commercial uses to the west and east, and the Lakeshore West GO rail corridor to the south. The site location is shown in **Exhibit 1**.

The site was formerly the location of the General Electric Canada Lamp Plant. It is currently vacant, with the exception of a 2-storey former GE office building along South Service Road.

A Temporary Use By-law was granted in May 2024 to permit the temporary use of the site for the outdoor storage of trailers, motor vehicles and shipping containers for use as storage containers.

The proposed redevelopment is for a mixed-use community containing in the order of 7,000 units, a mix of non-residential uses and a large public park. A network of new streets is contemplated through the site and through the surrounding Midtown Oakville neighbourhood, consistent with the Town of Oakville's Midtown Oakville Draft OPA (April 2024).

Exhibit 1: Site Location

1.0 SCOPE OF WORK

1.1 Study Area Intersections

The study area is proposed to comprise of the following intersections:

Existing Intersections

- Trafalgar Road & Iroquois Shore Road / Leighland Avenue
- Trafalgar Road & North Service Road / Highway 403 WB Off-Ramp
- Trafalgar Road & Highway 403 EB Off-Ramp
- Trafalgar Road & Argus Road
- Trafalgar Road & Cross Avenue / South Service Road East
- Trafalgar Road & Cornwall Road
- South Service Road East / Davis Road
- South Service Road East / Chartwell Road
- South Service Road East / The Canadian Road & Royal Windsor Drive / Highway 403 WB On/Off Ramp

Future Intersections (to be constructed with the buildout of the site and the Midtown Oakville Road Network)

- Cross Avenue / South Service Road
- Site-related Intersections (to be determined)

1.2 Traffic Analysis Periods

Traffic analysis will be undertaken for the weekday morning and afternoon peak hours within the peak periods of 7:00 a.m. – 9:00 a.m. and 4:00 p.m. – 6:00 p.m., respectively.

1.3 Traffic Analysis Scenarios

Traffic analysis will assume a 20-year buildout for the site as well as the Midtown Oakville OPA road network. The following scenarios will be reviewed:

- Existing Conditions (2024)
- Future Background Conditions (2044), assuming background development traffic (discussed below) and the full buildout of the ultimate road network
- Future Total Conditions (2044), assuming the buildout of the site and the full buildout of the ultimate road network

1.4 Study Guidelines / Policies

The following guidelines will be referenced:

- Halton Region's Transportation Impact Study Guidelines (January 2015)

- Halton Region's Access Management Guideline (January 2015)
- Town of Oakville's Livable by Design Manuals
- Draft Midtown Oakville Official Plan Amendment (2024)

1.5 Data Collection

Traffic data collection, including data related to pedestrians, cyclists, vehicles, trucks, and buses has been undertaken by Spectrum Traffic Data Inc. on behalf of BA Group on Tuesday, June 4th, 2024. The relevant signal timing plans have been requested from the Town of Oakville.

1.6 Background Traffic

1.6.1 General Corridor Growth

Historical counts at intersections along Trafalgar Road in the study area will be reviewed to determine an appropriate corridor growth assumption, if any, to apply along the study area roads.

1.6.2 Background Developments

Potential future developments based on active applications found on the Town of Oakville's development application portal are being reviewed to determine the additional traffic to be added to the study area intersections. The following developments have been identified and will be included as a part of this study:

- 157-165 Cross Avenue
- 177 Cross Avenue
- 207 Cross Avenue & 571 Argus Road
- 570 Argus Road
- 590 Argus Road
- 166 South Service Road
- 271 Cornwall Road
- 349 Davis Road
- 599 Lyons Lane
- 627 Lyons Lane

1.7 Site Trip Generation

Travel demands for vehicles, transit users, cyclists, and pedestrians will be determined using information from the 11th Edition of the ITE Trip Generation Manual.

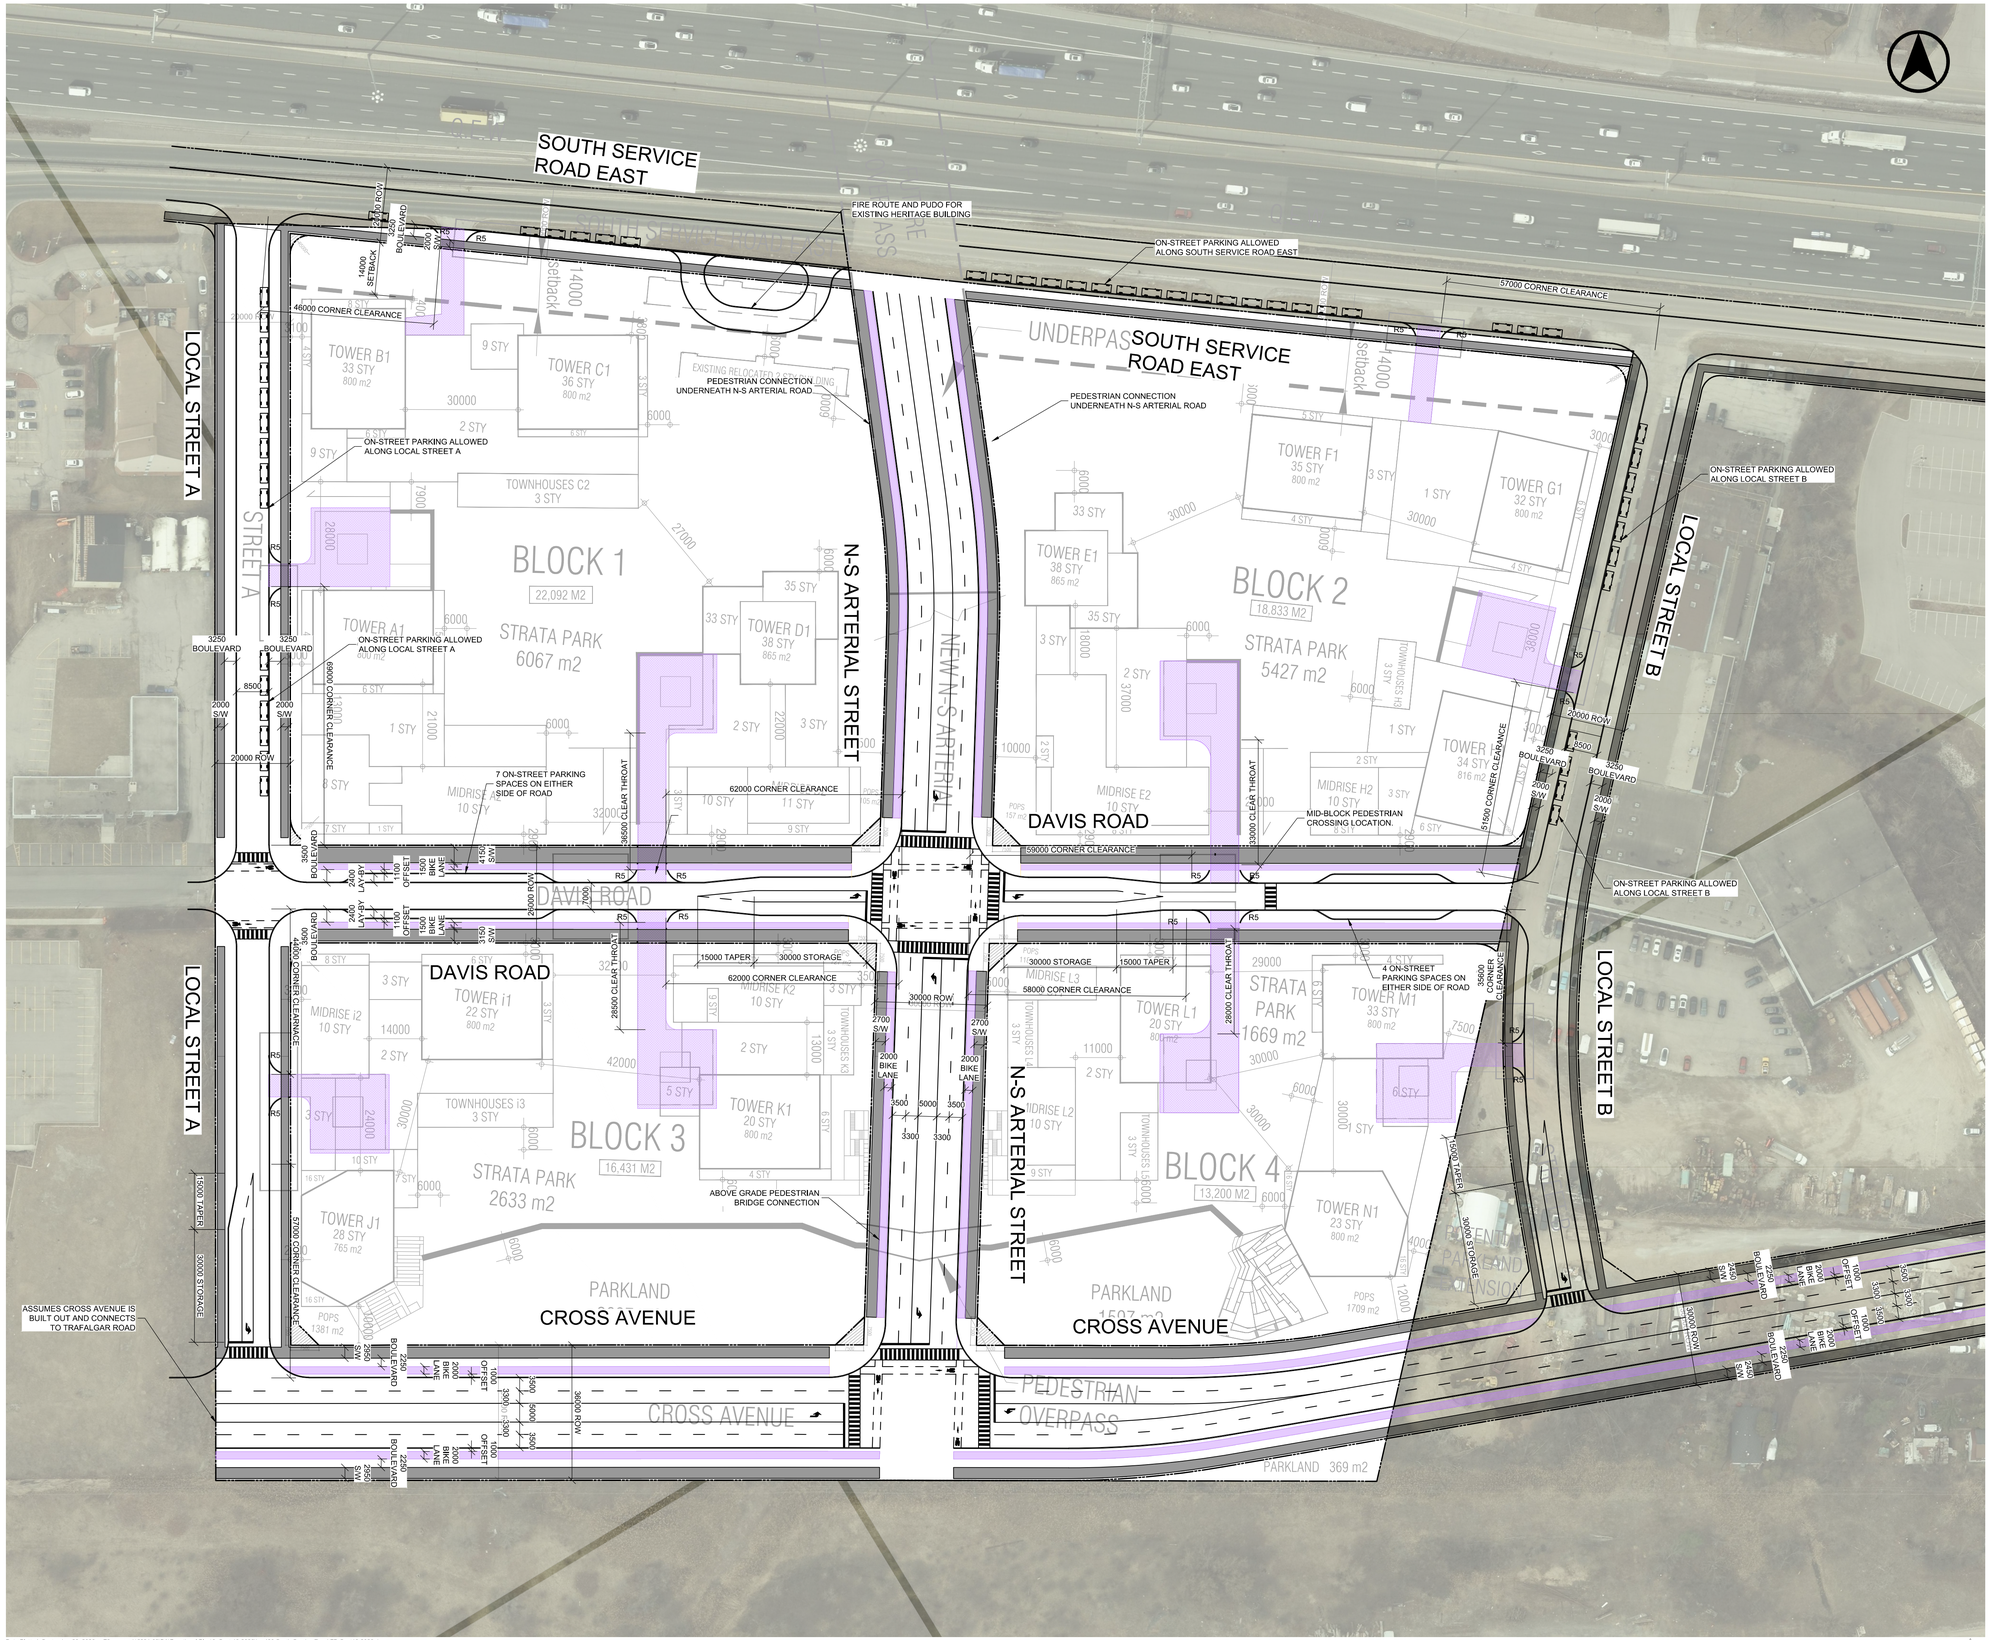
Additionally, the Transportation Tomorrow Survey (TTS) will be reviewed to determine mode splits, in conjunction with information collected from the proxy site surveys.

1.8 Trip Distribution

Vehicle, pedestrian, transit, and cycling trips will be distributed using information from the TTS as well as a review of existing travel patterns from the turning movement counts.

1.9 Traffic Analysis

Traffic analysis will be undertaken using Synchro 11 software.



2.0 TRANSPORTATION DEMAND MANAGEMENT

A TDM Plan, which seeks to reduce the number of single-occupant vehicle trips generated by the site, will be provided in the TIS.

3.0 VEHICLE PARKING, LOADING AND BICYCLE PARKING

The appropriateness of the supply of vehicle parking, loading and bicycle parking spaces for the site will be reviewed in the context of relevant Town and Provincial zoning bylaws and policies.

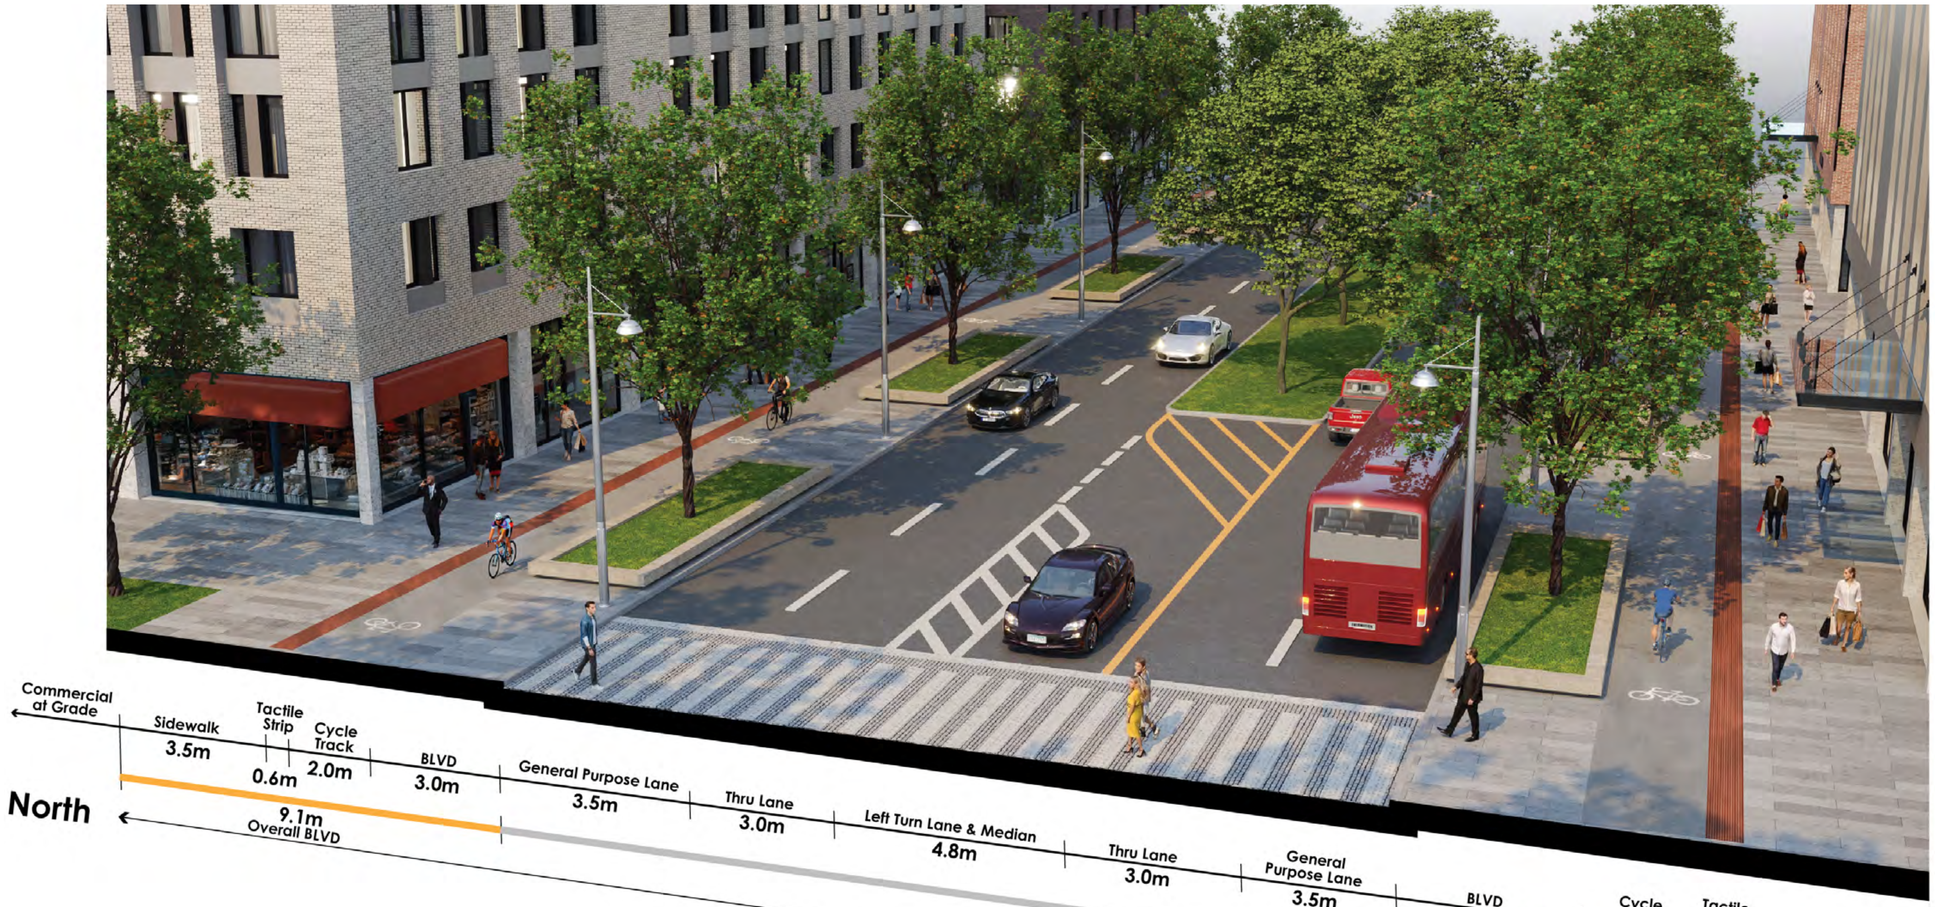
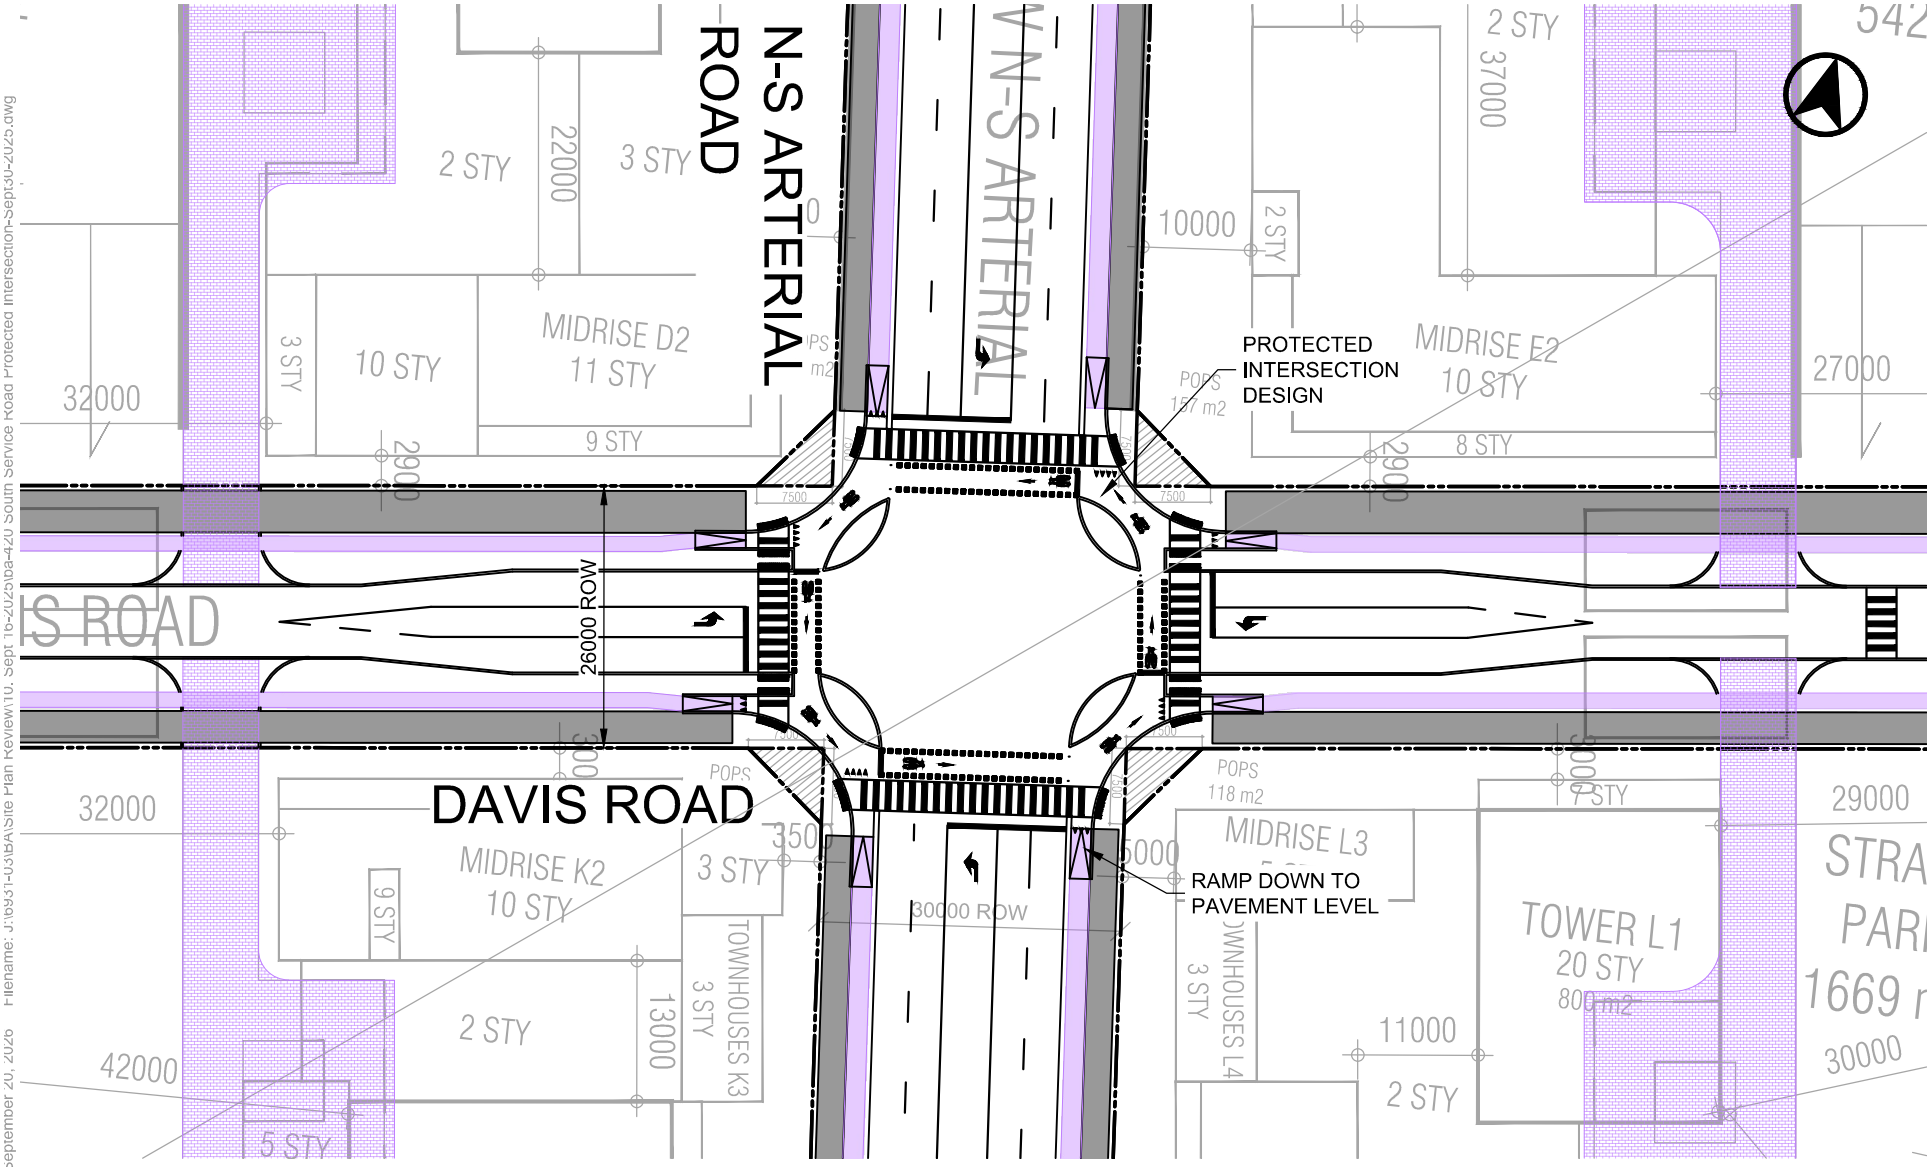
MOBILITY

ARGUS/DAVIS

Argus/Davis is envisioned as a vibrant main street with substantial pedestrian areas and opportunities for outdoor dining. Traffic and bike movement in both directions has been organized to maximize pedestrian mobility and activity.



MOBILITY



CROSS AVE

Cross Ave provides access to the GO Station, accommodates bus routes, includes bike lanes and a generous public realm that will create a functional and attractive street that offers a high level of transit and pedestrian connectivity.

6 Trip Generation for Mixed-Use Development

6.1 Background

Most data presented in *Trip Generation Manual* were collected at single-use, free-standing sites. However, development sites with two or more complementary land uses are now much more common and a method to accurately estimate the external trip generation effects of these types of developments is needed. At a development site consisting of two or more land uses, there is potential for interaction among those uses (referred to as "internal capture trips"), particularly where the trip can be made by walking. As a result, the total generation of external trips (that is, those entering and exiting the overall site) may be less than the simple sum of the trips generated by each discrete land use.

The recommended methodology is the same recommended procedure presented in NCHRP Report 684*: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments.*[7] The NCHRP report provides details on the development of the recommended estimation procedure, its underlying data, and validation of the estimation procedure. The report includes a summary of past research on trip generation and internal trip capture at mixed-use developments, as well as a discussion of other estimation methods that may be appropriate for the analyst to consider.

The recommended approach conforms to the Chapter 3 flow chart for estimation of site trip generation (see Figure 3.1):

- The baseline vehicle trip generation estimates are produced using the procedures presented in Chapters 4 and 9, as appropriate;
- Vehicle trip estimates are converted to person trips using methods presented in Chapter 5;
- The product of the process recommended in this chapter is an estimate of the total person trips entering or exiting the study site, after trips internal to the site (by walking, bicycle, transit, or personal passenger vehicle) are subtracted from total person trips generated by the study site;
- If the mixed-use site is located in an urban infill setting or near a rail transit station or a multi-route bus transit center with high-frequency service, the procedures presented in Chapters 7 and 8 should be applied to the product of the person trip estimates produced in this chapter; and
- Mixed-use development can attract vehicle traffic that is currently on adjacent or nearby streets. Refer to Chapter 10 for guidance on estimating pass-by and diverted trips.

6.2 Definition of Mixed-Use Development

For the purpose of this *Handbook*, a mixed-use development is typically a single real-estate development that consists of land uses corresponding to two or more ITE land use types between which trips can be made without using the off-site road system. A mixed-use development may also be referred to as a multi-use development.

---

[7] Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments.* Washington, DC: Transportation Research Board, 2011.

Because of the complementary nature of these land uses, some trips are made among the on-site uses. This capture of trips internal to the site has the net effect of reducing vehicle trip generation between the overall development site and the external street system (compared to the total number of trips generated by comparable land uses developed individually on stand-alone sites).

Mixed-use developments are commonly found ***ranging in size between 100,000 and 2 million sq. ft. of gross floor area within an overall area of up to roughly 300 acres***. The data presented in this chapter correspond to mixed-use developments in this size range. The recommended procedures for estimating trip generation at mixed-use developments are likely applicable at even larger sites, but the analyst is encouraged to collect and consider additional data.

A key characteristic of a mixed-use development is that trips between the various land uses can be made on site and these ***internal trips do not utilize the major street system***. In some mixed-use developments, these internal trips can be made either by walking or by vehicles using internal roadways without using external streets.

An ***internal capture rate*** can generally be defined as the percentage of total person trips generated by a site that are made entirely within the site. The trip origin, destination, and travel path are all within the site.

The trip reduction for internally captured trips is separate from the reduction for *pass-by trips*. These are two distinct components of trip-making behavior and both could be applicable for a proposed development. The internal trips, if present, should be subtracted *before* pass-by trip reductions are applied (refer to Chapter 10 for a complete discussion of pass-by trip estimation).

6.3 Mixed-Use Development Classified as a Single Land Use

A mixed-use development could consist of any combination of different land use types within a defined, congruous area. But that definition would encompass a wide range of potential applications, many of which are not intended to be the focus of this chapter.

A traditional **downtown or central business district** is ***not*** considered a mixed-use development for the purposes of this *Handbook*. Downtown areas typically have a mixture of diverse employment, retail, residential, commercial, recreation, and hotel uses. Extensive pedestrian interaction occurs because of the scale of the downtown area, ease of access, and proximity of the various uses. Automobile occupancy, particularly during peak commuting hours, is usually higher in the CBD than in outlying areas. Some downtowns have excellent transit service. For these reasons, trip generation characteristics in a downtown environment are different from those found in general urban or suburban areas. Most data presented throughout *Trip Generation Manual* from sites in suburban or outlying business district settings with limited or no transit service and free or inexpensive parking. **Accordingly, trip generation characteristics in this chapter, and specifically in the case of capture rates at mixed-use developments, are directly *applicable only to sites outside the traditional downtown***. Chapter 7 presents a recommended approach for estimating person trips generated in any urban setting including a downtown.

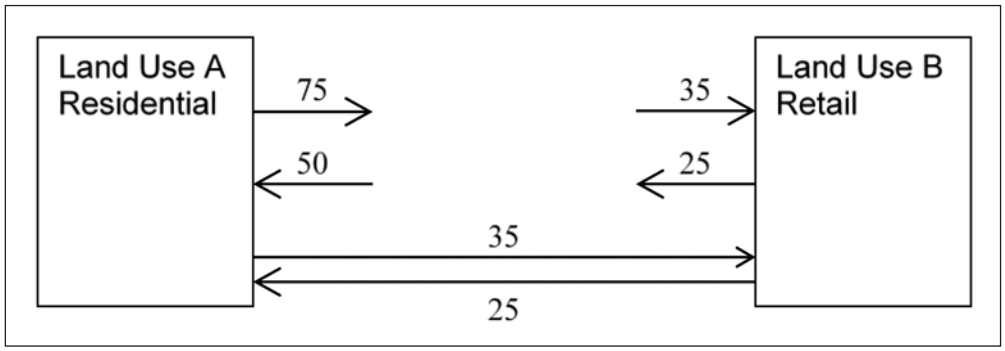
A **shopping center** could also be considered a mixed-use development because it typically includes uses other than general retail such as restaurants, banks, and office. However, because data have

been collected directly for them as a-stand-alone developments, shopping centers are considered in *Trip Generation Manual* as a single land use. The associated trip generation data presented in the *Manual* already reflect the effects of internal capture and the mixed-use nature of the center. ***Accordingly, internal capture rates are not applicable and should not be used to estimate trips for shopping centers if using statistics and data for Land Use Code 820***. However, if the shopping center is part of a larger mixed-use development or if it is planned to have out-parcel development of a significantly different land use type, such as residential, the site could be considered a mixed-use development for the purpose of estimating site trip generation.

A subdivision or planned unit development containing general office buildings and support services such as banks, restaurants, and gasoline service stations arranged in a park- or campus-like atmosphere should be considered an **office park** (Land Use Code 750), not a mixed-use development. An office building with support retail or restaurant facilities contained inside the building should be treated as a **general office building** (Land Use Code 710) because the *Manual* data already reflect such support uses. A **hotel with an on-site restaurant and small retail** falls within Land Use Code 310 and should not be treated as mixed-use development.

6.4 Underlying Assumptions about Internal Capture at a Mixed-Use Site

The internal trip-making characteristics of a mixed-use development site are directly related to its mix of on-site land uses (which are typically a combination of office, retail, restaurant, cinema/entertainment, residential, or hotel). When combined within a single mixed-use development, these land uses tend to interact and thus attract a portion of each other's trip generation. As should be expected, the observed internal capture rates for mixed-use developments vary by time of day, mix of on-site land uses, and size of the development.



Four premises form the basis for the recommended methodology:

- **Premise 1:** The distribution of trip purposes among persons entering or exiting a development site is relatively stable. In other words, the ratios of commute trips, work trips, and visitor trips to or from an office building is roughly the same whether the building is stand-alone or within a mixed-use development.
- **Premise 2:** The distribution of destination land uses (that is, at the other end of a trip from the development site) is likewise assumed to be relatively stable. For example, the destinations of trips from an office building are distributed among the many potential destinations (such as retail or residential) in roughly the same pattern whether the office is a stand-alone site or in a mixed-use development.
- **Premise 3:** The converse of Premise 2 is also true, that the distribution of origins for trips to a particular land use is assumed to be relatively stable.
- **Premise 4:** The number of trips from a land use within a mixed-use development to another land use within the same mixed-use development (that is, an internal trip) is a function of the size of the "receiving" land use and the number of trips it attracts, as well as the size of the "originating" land use and the number of trips it sends. ***The number of trips between a particular pair of internal land uses is limited to the smaller of these two values.***

Key to the success of this methodology in replicating internal capture patterns at mixed-use sites is its balancing step that constrains internal trip-making to realistic levels given the mix of land uses. Figure

6.1 shows an example of this balancing. Assume Land Use A is a large residential development and Land Use B is a smaller retail component of a mixed-use development. The residential development is large enough to generate 75 peak hour outbound trips that could go to an on-site retail destination, and could attract 50 inbound trips from an on-site retail origin. However, in this particular mixed-use development, the retail portion of the development is only large enough to generate 25 peak hour outbound trips to an on-site residential destination and 35 peak hour inbound trips from an on-site residential origin. Therefore with this particular combination of size and type of land uses, the mixed-use development internally captures a maximum of 35 trips from Land Use A to Land Use B and 25 trips from B to A. The remainder of the potential residential-to-retail on-site trips become external trips.

Figure 6.1 Balanced Internal Trips in Mixed-Use Development Example

Source: Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*. Washington, DC: Transportation Research Board, Figure 19, 2011.

6.5 Process for Estimating Mixed-Use Trip Generation

The recommended procedure for estimating internal trip capture and trip generation for a mixed-use development is a series of nine steps:

- Step 1: Determine whether methodology is appropriate for study site.
- Step 2: Estimate person trip generation for individual on-site land uses.
- Step 3: Estimate proximity between on-site land use pairs.
- Step 4: Estimate unconstrained internal person trip capture rates with proximity adjustment.
- Step 5: Estimate unconstrained demand between on-site land use pairs.
- Step 6: Estimate balanced demand between on-site land use pairs.
- Step 7: Estimate total internal person trips between on-site land use pairs.
- Step 8: Estimate total external person trips for each land use.
- Step 9: Calculate overall internal capture and total external vehicle trip generation.

A ***spreadsheet tool*** is available which automatically performs many of the required calculations based on input data. The spreadsheet tool can be downloaded from within the Other Resources link in the Trip and Parking Generation section of the ITE website (www.ite.org/tripgeneration/index.asp).

If using the spreadsheet tool, the analyst needs to complete Steps 1 through 3. The estimation tool automatically calculates overall internal capture and total external vehicle trips in Steps 4 through 8 and summarizes the results. The complete step-by-step procedure is provided here

if the analyst chooses to do the calculations manually (if the analyst, for example, is using local data to supplement the national database). Appendix F contains an example application of the recommended process.

The step-by-step procedure and spreadsheet contain data that enable the analyst to evaluate internal capture at a mixed-use site with any combination of office, retail, restaurant, cinema/ entertainment, residential, and hotel land uses. Because data are not currently available for other land use categories, internal capture to and from those uses is assumed to be zero in the spreadsheet tool.

The analyst is cautioned that each mixed-use development has unique characteristics that influence the extent of internal trip capture. Such characteristics include, but are not limited to, the following:

- The number and magnitudes of complementary land uses;
- The layout of the land uses relative to each other;
- Specific businesses, residence types, and other component characteristics within each land use category;
- Proximity and connectivity between each pair of land uses;
- Design characteristics of the development and its internal transportation system;
- Specific characteristics of the development's access and parking; and
- Competing opportunities outside the development.

6.5.1 Step 1: Determine Whether Methodology Is Appropriate for Study Site

The procedure should be used for estimating internal capture only at a mixed-use development that has characteristics resembling the sites from which the internal capture rates have been derived. In determining if the recommended procedure is appropriate for a particular mixed-use development, the analyst should consider at least the following factors:

- **Development Type:** The mixed-use development should be a single, physically and functionally integrated development on a single development block or a group of contiguous blocks with two or more uses, with internal pedestrian and vehicular connectivity, and with shared parking among some or all uses. The site should have sufficient parking supply to meet demand although the most convenient parking may sometimes fill during peak demand periods.
- **Development Location:** The mixed-use development should be downtown fringe, general urban, or suburban. It should not be located either within or adjacent to a central business district. Trip generation for a study site in a CBD setting is addressed in Chapter 7.
- **Development Size:** The data that form the bases for the internal capture methodology are from mixed-use development sites that have between 100,000 and 2 million sq. ft. of building space and an overall acreage of up to roughly 300 acres. The mixed-use development should fall within those ranges. It can be a single site, a block, or a district or neighborhood (with multiple interconnected or interactive blocks within a defined boundary); however, this procedure should not be used for a development composed of different adjacent, but not directly connected, land uses. Adjacent blocks can be considered to be directly connected if there is an internal street, driveway, alley system, or pedestrianway by which person trips can be made to travel from one block to another. If the development site has multiple land uses and the blocks are configured in such a way that internal trips must exit the site and use an external street system, then the site is not a mixed-use development.

- **Land Use Mix:** The mixed-use development should consist of a combination of at least two of the following uses: retail, restaurant, office, residential, hotel, and cinema/entertainment. Internal capture for land uses beyond these six should be considered to be zero (unless comparable survey data for other land uses are provided) because there are no supporting data from which to derive an appropriate percentage. In addition, if a substantial portion of the land use at a mixed-use site is outside these six land uses, the *Handbook* internal capture rates might not be appropriate. Alternatively, the analyst can collect internal capture data at proxy sites with similar land use and setting characteristics.
- **ITE *Trip Generation Manual* Database:** The mixed-use development should not already be covered in the ITE trip generation database as reported in the latest edition of *Trip Generation Manual*. Current ITE Land Use types that already account for internal trip-making include shopping center, office park with retail, office building with ground floor retail or on-site cafeteria, and hotel with limited retail and restaurant space.
- **Time Period for Analysis:** The internal capture rates contained in this *Handbook* cover the weekday AM and PM peak periods for adjacent street traffic. Internal capture rates for weekend peak periods, for weekday midday peak periods, or for a daily period should not be assumed to be the same as or even a simple, direct function of the weekday AM and PM peak period rates. The analyst should collect additional data. Refer to section 6.7 of this chapter for guidance.

If the mixed-use development type, location, or size is not compatible with the sites in the internal capture database or if an estimate of internal capture during the midday or on a weekend is desired.

6.5.2 Step 2: Estimate Person Trip Generation for Individual On-Site Land Uses

The purpose of the second step is to estimate the **person** trips generated for each on-site land use. Person trips can be estimated from

- Directional (in, out) vehicle trip generation estimates for each land use;
- Mode share (percent of external person trips in personal passenger vehicle, truck, transit, and non-motorized) for each land use; and
- Vehicle occupancy for each land use.

These are **baseline** assumptions. They are used to factor baseline vehicle trip estimates to baseline person trip estimates which are assumed to be the same as study site person trip estimates. These should not reflect anticipated or potential changes in study site external mode shares (for example, walk trips to/from a mixed-use development in an infill setting or transit trips to/from a mixed-use development near a transit station). Those **external** mode share calculations are addressed in Chapters 7 and 8.

The following paragraphs describe the data requirements for each set of inputs, including references to the appropriate location on the spreadsheet tool where each data item should be entered. Figure 6.2 presents the PM peak hour input and output pages in the spreadsheet model. The spreadsheet also includes AM peak hour input and output pages and internal capture rate look-up tables for both AM and PM.

Vehicle Trip Generation by Land Use. The analyst should estimate vehicle trip generation for each component land use using the procedures presented in Chapters 3 and 4 of this *Handbook*.

The recommended procedure can estimate internal trip capture for the following generic land use categories: office, retail, restaurant, residential, hotel, and cinema/entertainment.

Therefore, for the purpose of estimating internal capture, the analyst must consolidate individual appropriate land uses into the above land use categories. As an example, for a mixed-use development containing apartments and townhouses, compute vehicle trips generated for each and total them to estimate the total residential vehicle trips. The vehicle trip generation estimates should be entered in Table 1 of the spreadsheet tool shown in Figure 6.2 as entering or exiting vehicle trips.

The recommended procedure estimates internal capture only for trips to/from land uses that fall into one of the above six categories. Also included in Table 1 of the estimator spreadsheet is a row for the analyst to input the inbound and outbound vehicle trip generation data for all other land uses that are not subject to internal trip capture computations. If there are multiple on-site land uses that are not subject to internal trip capture, the individual land use estimates should be combined before entering into the “All Other Land Uses” row. These trips are automatically assumed to be external trips (that is, with no internal capture) in subsequent computations.

The spreadsheet calculates the total of the entering and exiting vehicle trips for the individual land uses.

Source: An adaptation of a figure in NCHRP 684 (called Tables 103 and 104). Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments.* Washington, DC: Transportation Research Board, 2011.

Vehicle Occupancy. The procedure requires vehicle occupancy rates in order to convert baseline trip generation estimates from vehicle trips to person trips. The analyst should use the common values reported in Chapter 5 (and Appendix B) if that set of data is sufficient for the study site analysis. The baseline vehicle occupancy data should be for the same land use type, represent the same general setting, and be composed of at least three data points in order to be considered sufficient. If not, the analyst should collect vehicle occupancy data at a sufficient number of nearby proxy sites.

Enter the vehicle occupancy for each land use category in Table 2 of the spreadsheet. Note that the analyst may enter separate expected vehicle occupancy levels for each land use by direction. If no vehicle occupancy data are entered, a vehicle occupancy of 1.0 persons per vehicle is assumed in the spreadsheet.

Mode Share. The procedure requires the analyst to determine the baseline mode shares for external person trips generated by individual land uses within the mixed-use development. Mode shares should be divided into at least total vehicles (personal passenger vehicles plus trucks), transit, and non-motorized modes such as bicycle or walking. The analyst should use the common mode share values reported in Chapter 5 (and Appendix B) if that set of data is sufficient for the study site analysis. The baseline mode share data should be for the same land use type, represent the same general setting, and be composed of at least three data points in order to be considered sufficient. If not, the analyst should collect mode share data at a sufficient number of nearby proxy sites.

Enter the mode shares associated with each land use category in spreadsheet Table 2. Note that the vehicle occupancy and mode share data are also entered for land uses not subject to internal trip capture computations for the purposes of mode assignment for these trips (all external trips) and is provided solely for convenience. If no mode share values are entered by the analyst, 100 percent of the person trips generated by a land use within the mixed-use development are assumed to be in vehicles.

It is preferable for the analyst to use a reasonable estimate for the baseline mode shares and vehicle occupancy. However, if the analyst is only going to calculate and use vehicle trips (and not person trips or trips by travel mode) AND if the mixed-use development is in a suburban setting with an expectation for very few external walk, bike, or transit trips, it is acceptable to assume[8] that

- 100 percent of person trips are in vehicles; and
- Vehicle occupancy is 1.0 person per vehicle.

If the mixed-use development is located in an infill setting or close to significant transit service, the calculation of external mode shares and vehicle occupancy for the **study site** requires the use of a reasonable estimate for **baseline** mode shares and vehicle occupancy. As stated later in the Urban Infill chapter (in section 7.4.1), for such a development, it is incorrect to simply assume baseline values of 100 percent person trips by vehicle and a 1.00 vehicle occupancy.[9]

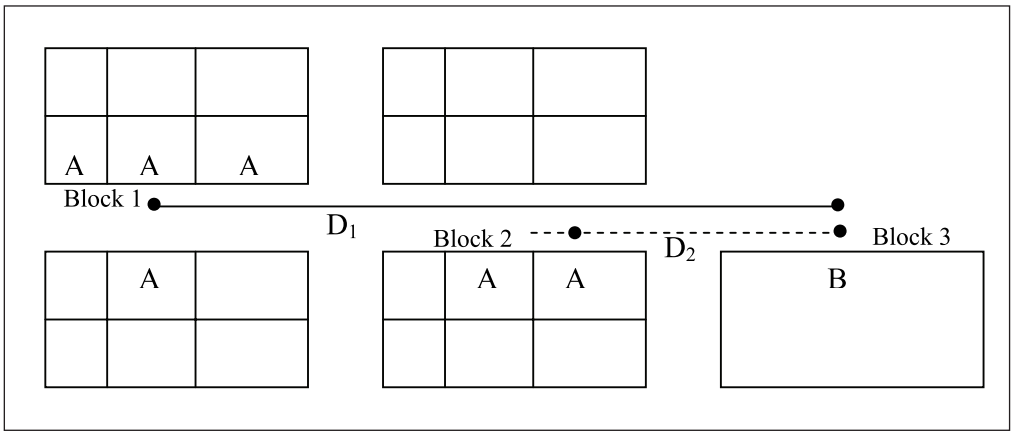
---

[8] Because the baseline and study site mode shares and vehicle occupancy are not expected to be different for a suburban, stand-alone mixed-use development.

[9] Because it will result in an **over**-estimate of vehicle trip reductions that result from the infill setting or proximity to significant transit.

6.5.3 Step 3: Estimate Proximity between On-Site Land Use Pairs

Unconstrained internal trip capture rates between certain land use pairs can vary as a function of distance between the uses. In order to account for that distance, the recommended procedure uses the average distance between pairs of interacting land uses within the mixed-use development. Determine the average distances between individual on-site land use pairs that are present in the study site development.



The **only land use pairs** for which proximity adjustment factors are available (and therefore are the only land use pairs for which distances are used in the analysis) are the following:

- Office-to-retail;
- Office-to-restaurant;
- Office-to-residential;
- Retail-to-residential;
- Restaurant-to-residential;
- Cinema/entertainment-to-residential;
- Residential-to-retail;
- Residential-to-restaurant; and
- Hotel-to-residential.

The **only time period** for which sufficient data are available to derive a reliable proximity relationship is the weekday PM peak period. In this procedure, AM peak period internal capture rates are **not** adjusted to reflect distance between land uses.

The recommended procedure for measuring the distance between two on-site land uses is as follows. If there is only one building of each land use category (for example, one apartment building and one office building), enter the walking distance between the entrances to each building. If there is a group of buildings or businesses of one land use category in an area, separate that land use into blocks, with a block being the building faces along both sides of a street (see Figure 6.3 for an example). Locate the centroid of the entrances of each specific land use for each block. Measure the distance between each block centroid of that land use and the other, interacting land use. If there are multiple blocks, the analyst should measure between all pairs of blocks and use the weighted average distance, using square feet of land use involved in each exchange as the weighting factor.

Figure 6.3 Sample Measurement of Proximity for Land Uses in Multiple Blocks

Source: Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: E*nhancing Internal Trip Capture Estimation for Mixed-Use Developments.* Washington, DC: Transportation Research Board, adapted from Figure 24, 2011.

In the Figure 6.3 example, the dots represent the centroids of the entrances for Land Use A in blocks 1 and 2 and for Land Use B in block 3. The distances D_1 and D_2 are the respective distances from Land Use A in blocks 1 and 2 to Land Use B in block 3. The weighted average distance between Land Use A and Land Use B is

$$\textit{weighted distance} = \frac{(D1 * \textit{land use A sq. ft. in block } 1) + (D2 * \textit{land use A sq. ft. in block } 2)}{\textit{land use A sq. ft. in blocks } 1 \textit{ and } 2}$$

$$D_{WTD} = ((D_1 * A_{LU\text{-}1}) + (D_2 * A_{LU\text{-}2})) / (A_{LU\text{-}1} + A_{LU\text{-}2})$$

where

D_{WTD} = weighted average distance between Land Uses A and B

D_1 = distance between block 1 and block 3

D_2 = distance between block 2 and block 3

$A_{LU\text{-}1}$ = Land Use A square feet in block 1

$A_{LU\text{-}2}$ = Land Use A square feet in block 2

For each pair of interacting land uses, enter a distance (in feet) by the prevailing travel mode into Table 3 in the estimator spreadsheet tool.

6.5.4 Step 4: Estimate Unconstrained Internal Person Trip Capture Rates with Proximity Adjustment

In this step, unconstrained internal trip capture rates that are appropriate for the subject mixed-use development site are determined. The spreadsheet tool automatically determines the rates. The following description is provided to enable the analyst to understand the derivation of the data.

Base internal trip capture rates are identified in Step 4A. These initial rates are modified to account for specific proximity characteristics of the study site mixed-use development in Step 4B. The final proximity-adjusted internal trip capture rates are calculated using simple multiplication as described in Step 4C.

Step 4A: Estimate Base Unconstrained Internal Trip Capture Rates

Internal trip capture rates have been developed for land use pairs with the following generic land use categories: office, retail, restaurant, residential, hotel, and cinema/entertainment.

Table 6.1 presents estimated unconstrained internal trip capture rates for **trip origins** within a mixed-use development. For example, during the weekday AM peak hour, of all the person trips exiting an on-site retail land use, as many as 29 percent of the trips could be destined for an on-site office and as many as 14 percent could be destined to an on-site residential use.

Table 6.2 presents estimated unconstrained internal trip capture rates for **trip destinations** within a mixed-use development. For example, during the AM peak hour, of all the person trips entering an on-site retail land use, as many as 32 percent of the trips could originate at an on-site office and as many as 17 percent could originate at an on-site residential use.

It should be noted that no internal trip capture rates are provided between a land use and itself. This is because an internal trip between two components of similar land use type is implicitly accounted for when estimating trip generation for that particular land use.

The internal trip capture rates presented in Tables 6.1 and 6.2 are considered “unconstrained” because they represent the maximum potential trip interaction between two land uses, by direction. Subsequent steps of the recommended estimation procedure adjust the unconstrained person trips to account for site-specific constraints that limit the internal trip capture achieved for a given land use pair.

Tables 6.1 and 6.2 report unconstrained internal trip capture rates for an AM street peak hour (typically between 7:00 and 9:00 a.m.) and a PM street peak hour (typically between 4:00 and 6:00 p.m.). The internal trip capture rates presented are only valid for trip generation studies during those time periods. Data for other periods, such as weekday daily, weekday mid-day, or weekends are not available.

If the analyst finds a table value of zero for a particular land use pair (or a value well below a logical value), the analyst has the option to collect internal capture information at a proxy mixed-use development site with the same pair of land uses. Section 6.7 of this chapter provides guidance on how to collect appropriate internal capture data. In this circumstance, the analyst does not need to survey an entire mixed-use development, just the two land uses that are the target pair.

If the mixed-use development study site contains a land use for which unconstrained internal capture rates are not provided in Tables 6.1 and 6.2, the analyst should either (1) assume no internal capture for trips to and from that land use or (2) establish an internal capture rate through the conduct of

intercept surveys at a proxy mixed-use development site with the same land use Codes. Section 6.7 of this chapter provides specific guidance on the types of information to gather in the data collection process. Although an assumption of no internal trip capture may be unrealistic, the recommended procedures do not account for land uses not listed in the table. In the absence of any supporting data, it would, of course, be more conservative to potentially over-estimate external trip generation. If the land use is truly unique and one for which no proxy sites exist, a reasonable assumption supported by documentation should be appropriate.

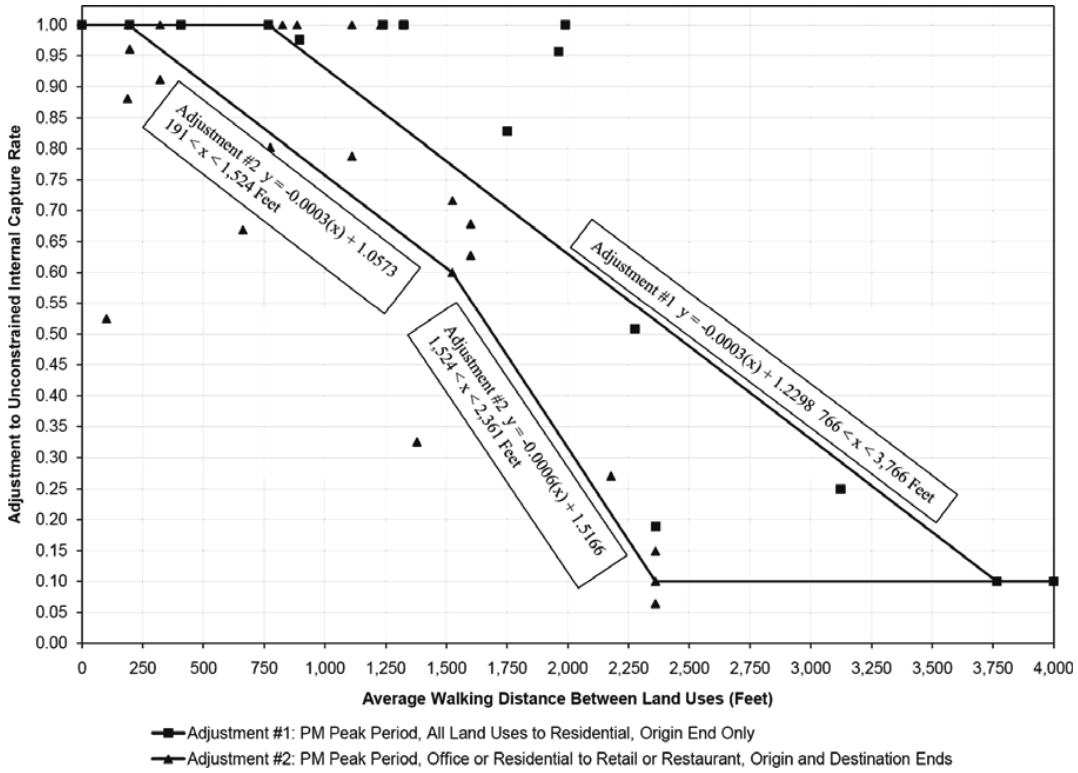
Source: Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments.* Washington, DC: Transportation Research Board, Tables 101 and 102, 2011.

Step 4B: Apply Proximity Adjustment Factors (PM Peak Hour Only)

The unconstrained internal capture values presented in Tables 6.1 and 6.2 represent rates to be expected between land use pairs that are not affected by proximity. As some land use pairs are located farther apart, the unconstrained internal capture rates may decline. Step 4B of the estimation procedure accounts for the specific proximity characteristics of the mixed-use development. Proximity adjustment factors are included for only the land use pairs for which the available data clearly demonstrates a direct relationship between proximity and internal capture rate. These are composed of only PM peak period trips from

- All land uses to residential and applicable only to the trip origin end;
- Office to retail or restaurant, applicable at both the origin and destination ends of a trip; and
- Residential to retail or restaurant, applicable at both origin and destination ends of a trip.

No proximity adjustments are available for the AM peak period.



If a land use pair is not included in the above list, the Table 6.1 and Table 6.2 unconstrained internal capture values are used without adjustment. Figure 6.4 shows the two curves that establish the relationship between proximity and internal trip capture rate. The proximity adjustment is equal to 1.0 for land uses in close proximity, and declines as distances between land uses increases. The lowest possible value for the proximity adjustment factor is 0.10, thereby allowing for a minimal amount of internal trips between two on-site land uses at a mixed-use development regardless of the distance between the two uses.

The estimation tool calculates the proximity adjustment factor automatically based on the land use proximity measurements calculated in Step 3 and entered by the analyst in Table 3.

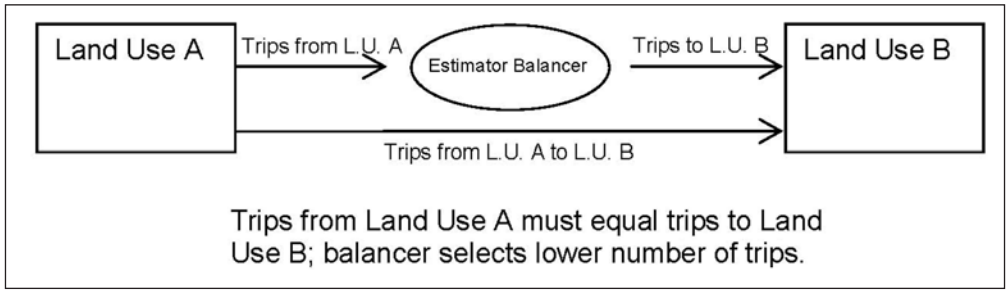
Step 4C: Calculate Proximity-Adjusted Internal Trip Capture Rates

For each applicable land use pair and direction, the appropriate unconstrained internal trip capture rate from Table 6.1 or 6.2 (Step 4A) is multiplied by the proximity adjustment factor calculated in Step 4B to obtain the proximity-adjusted internal trip capture rates to be utilized in subsequent steps of the estimation procedure. The results appear in Table 7 of the spreadsheet.

Figure 6.4 Proximity Adjustment Factors for Unconstrained Internal Trip Capture Rates within a Mixed-Use Development

Source: Bochner, B., K. Hooper, B. Sperry, and R. Dunphy. NCHRP Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*. Washington, DC: Transportation Research Board, Figure 22, 2011.

6.5.5 Step 5: Estimate Unconstrained Demand between On-Site Land Use Pairs



In this step, unconstrained demand between on-site land use pairs is estimated. The proximity-adjusted internal trip capture rates (from Step 4) are multiplied by the appropriate directional person trip generation value in the estimation spreadsheet tool (calculated earlier in Step 2). For each pair of land uses, four values for unconstrained demand will be estimated, two for each direction of travel (as demonstrated earlier in Figure 6.1). The origin-destination matrix for unconstrained internal trips between on-site land uses computed at the origin is reported in Table 8(O) in the computational details worksheet of the spreadsheet estimator tool. The origin-destination matrix for unconstrained internal trips between on-site land uses computed at the destination is reported in Table 8(D).

6.5.6 Step 6: Estimate Balanced Demand between On-Site Land Use Pairs

In this step, internal demand volume is balanced by direction by comparing the values in the corresponding cells of Table 8(O) and Table 8(D) for each land use pair and selecting the lower value. The purpose of this step is to balance the estimates of directionally internally captured trips

between land uses. Figure 6.5 illustrates the concept on internal trip balancing between land uses within a mixed-use development.

Figure 6.5 Estimator Balancing Concept

This step is performed for two reasons:

1. Estimates for each individual land use are based on the quantity of that land use and its capacity to send or receive internal trips. Without balancing, there is no assurance there is enough capacity on the receiving end to accept as many trips as are being sent.
2. The total trips sent internally (that is, internally captured trips) from one use to another must equal the number received at the other end of the trip. Both numbers must be the same.

The balanced demand for each land use pair is calculated by the spreadsheet tool with the results posted in Table 4 on the main estimator tool worksheet.

6.5.7 Step 7: Estimate Total Internal Person Trips between On-Site Land Use Pairs

In this step, total internal person trips are estimated by adding the internal trips *to* each other land use, then totaling the internal trips *from* each other land use. These totals are calculated and posted in the computational details worksheet in the “Internal” column of Table 9(D) for entering trips and Table 9(O) for exiting trips.

The analyst should review these values and verify that they appear reasonable.

6.5.8 Step 8: Estimate Total External Person Trips for Each Land Use

In this step, total external person trips are estimated by subtracting the estimated internal trips from the total trips for each individual land use. For entering trips, the spreadsheet tool subtracts the total internal trips for each land use as calculated in Step 7 from the total person trips from Table 7(D). The total external trips by land use are produced by the worksheet in the “External” column of Table 9(D) for entering trips and Table 9(O) for exiting trips.

6.5.9 Step 9: Calculate Overall Internal Capture and Total External Vehicle Trip Generation

The final step is calculation of the *total net external vehicle trip generation* for the mixed-use development site. The total external trips by land use reported in the "External" column of Table 9(D) for entering trips and Table 9(O) for exiting trips represent the total external person trips expected at the mixed-use development site. The total external person trips generated is multiplied (within the spreadsheet tool) by the expected mode shares of external person trips by land use (Table 2) to compute the total external person trips by mode for each land use. The total external person trips by transit and non-motorized modes are reported in the two far right columns of Table 9(D) for entering trips and Table 9(O) for exiting trips. The balance of person trips for each land use and direction are assumed to be vehicle trips. The estimated external person trips by vehicle are divided by the expected vehicle occupancy for each land use and direction (Table 2) to obtain the total external vehicle trip generation expected at the site.

Appendix G contains an example application of the recommended process.

The total person trips, external vehicle trips, external person trips by transit, and external person trips by non-motorized modes by direction are reported in Table 5 of the spreadsheet. The site *internal trip capture rate* is estimated by taking the sum of the all values in the internal person trip origin-destination matrix (Table 4) and dividing this value by the total person trips by direction (Table 7). The internal trip capture rate for each individual land use and direction of travel is calculated in a similar manner, and the results are reported in Table 6.

All of the data and calculations used in the spreadsheet tool should represent **baseline** conditions. The calculations do not reflect anticipated or potential changes in study site external mode shares (for example, walk trips to/from a mixed-use development in an infill setting or transit trips to/from a mixed-use development near a transit station). Those **external** mode share calculations are addressed in Chapters 7 and 8.

6.6 Cautionary Notes

The internal trip capture data and estimation procedure presented in Section 6.5 quantifies the influence of several key factors on internal trip capture rates. Numerous other factors have a direct influence on travel at a mixed-use development, factors for which the current data and estimation procedure do not account. Additional data and analysis are desirable to better quantify the relationships between these factors and mixed-use development trip generation and internal trip capture rates. A summary of the pertinent information contained in several existing documents is included in NCHRP Report 684.

Limited Sample Size—The estimated typical internal trip capture rates presented in Section 6.5 in Tables 6.1 and 6.2 rely directly on data collected at a limited number of mixed-use developments in Florida, Georgia, and Texas. While this *Handbook* recognizes the limitations of these data, they represent the only known credible site-level data on mixed-use internal trip capture rates and are provided as illustrative of typical rates. ***If local data on internal trip capture rates by land use pair can be obtained, the local data should be used and the data submitted to ITE for possible inclusion in future publications*** (refer to section 6.7 of this chapter for guidance).

Pass-By Trips—The application of pass-by trip reductions presented in Chapter 10 should likewise be applicable to mixed-use sites. However, none of the internal trips can be of a pass-by nature because they do not travel on the adjacent (external) street system. ***Pass-by trip percentages are applicable only to trips that enter or exit the adjacent street system***. Apply the pass-by trip estimation procedure in Chapter 10 of this *Handbook* only to the mixed-use development external vehicle trips.

Atypical Tenant Mix—The specific tenants at the mixed-use development sites from which the internal capture relationships in the recommended procedure are derived are relatively complementary. For example, the restaurants located near or adjacent to office buildings are often coffee shops or are geared to serve a lunchtime clientele and an after-work crowd. A family sit-down restaurant would likely generate a different level of internal capture with the on-site office. The analyst is cautioned to review the particular characteristics of the mixed-use development study site and its tenants before using the internal trip capture rates presented in Tables 6.1 and 6.2. The analyst should assess whether each set of internal trip capture rates makes sense considering the particular individual land uses within the specific, mixed-use development site.

Competing Markets—Proximity to competing markets is expected to influence internal trip capture rates. The greater the distance to external competing uses, the greater the likelihood of capturing trips internally within a mixed-use development site. However, at this time, there is no trip generation data available on which to base adjustment factors of this type. It is important to note that the modes of external trip-making to and from competing markets are addressed in Chapter 7, Trip Generation for Urban Infill/Redevelopment.

Other Site-Specific Issues—Many other issues potentially affect trip-making at mixed-use sites. For examples, can those who work on-site afford to live on-site? How long will it take for the office uses to attract work trips from on-site residences? Is there an internal pedestrian, bicycle, or transit circulation system or roadway network that enhances or discourages internal trips?

Shared Parking—Shared parking and mixed-use trip generation estimation methodologies, though similar, are not interchangeable. Shared parking factors cannot be applied directly to estimate trip generation at a mixed-use development.

6.7 Data Collection at a Mixed-Use Development

Chapter 12 provides guidance on a proper approach for collecting appropriate person and vehicle trip information at a mixed-use development. The procedures in the chapter focus on the conduct of a comprehensive data collection program to cover an entire mixed-use development.

If the analyst desires to focus on trip interactions between individual land use pairs at an existing mixed-use development, the procedures can be adapted. The data collection program will likely require intercept surveys similar to Chapter 12 survey instruments.

The modified data collection program must include

- Measurement of total person trips (directionally) between the specified land uses, and
- The proportions of all trips to/from the individual land uses that these trips between the specified land uses comprise.

If, for example, the analyst wants to determine internal capture between two land uses (A and B), the product of the data collection effort must produce at a minimum:

- There are an estimated X person trips from Land Use A to Land Use B during the time period;
- There are an estimated Y person trips from Land Use B to Land Use A during the time period;
- Of all person trips from Land Use A during the time period (both internal and external to the mixed-use development site), P percent go to Land Use B;
- Of all person trips to Land Use B during the time period (both internal and external to the mixed-use development site), Q percent come from Land Use A;
- Of all person trips from Land Use B during the time period (both internal and external to the mixed-use development site), R percent go to Land Use A; and
- Of all person trips to Land Use A during the time period (both internal and external to the mixed-use development site), S percent come from Land Use B.

Suggested procedures, survey instruments, sample sizes, and other pertinent information are presented in Chapter 12.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary			
Area Type:	Other		
Cycle Length: 120			
Actuated Cycle Length: 120			
Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green			
Natural Cycle: 80			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 0.65			
Intersection Signal Delay: 14.8		Intersection LOS: B	
Intersection Capacity Utilization 78.4%		ICU Level of Service D	
Analysis Period (min) 15
