Application Item	Comment	Response	Attachment
3.4(iii): Monthly Flow-through Rates Not Provided	The Applicant did not provide monthly flow-through rates. However, all daily flow-through rates provided are based on the provided annual flow-through rates. Therefore, monthly flow-through rates can be deduced in a similar manner.	See Attachment A for monthly production rates.	A
3.7(iii): More Information Required for Emissions Calculations	The Applicant is required to provide the following information in order to properly assess all emissions calculations. i) Provide rationale/source for paint usage and lining usage listed in Table D.11. ii) Provide sample calculation to indicate how emissions in Table 4 were obtained (i.e. how were the calculations in Attachment D combined to provide the numbers in Table 4). iii) Despite information provided, "VOCs Per Year" and "Particulate Per Year" numbers in Table D.7 cannot be replicated. Please provide sample calculation. In particular, discrepancies appear to be evident for Silk Screens #4 to #6.	- See Section 1 of Attachment B for rationale. See Section 2 of Attachment B for Sample Calculations. See Section B of Attachment A for Sample Calculations.	- B
4.2: BPIP Input File Not provided	The Applicant did not provide the associated BPIP input files for all model runs. Without the BPIP input file, the model characterization of all Facility buildings cannot be verified. The Applicant is requested to provide this information so that their modelling can be fully evaluated.	See Attachment D for Input files.	D
4.2.2: Model Grid Size	The Applicant used EPA default 25x25 grid, 4 km grid size, instead of Town default 100x100 grid, 1 km grid size. The Applicant is requested to provide an explanation for the deviation.	See Novus Report, "Response to HPAQB CALPUFF Model Oakville Facility Report Peer Review Comments."	C
4.2.2: Deposition	The Applicant did not invoke deposition, which is the EPA default method. The Applicant is requested to provide an explanation for the deviation.		
4.2.2: Ambient Temperature	The Applicant is requested to explain their methodology of setting the stack temperature at a value of 15°C for stacks exiting at ambient temperature.		
4.2.2: MESOPUFF Chemistry	Applicant included SO ₂ and NO _x in FPM model and invoked the MESOPUFF chemistry module despite not being a major emitter for either contaminant. Analysis of these emissions was not required; since this provides a conservative estimate of air-borne concentrations of FPM, however, the applicant may choose to leave this setting.		
4.2.2: Wind Speed Profile	The Rural Wind Speed Profile (variable PLX0) was used instead of the default Urban Wind Speed Profile. The Applicant is requested to provide an explanation for the deviation.		
4.2.2: Plume Path Coefficients	The default values for the Plume Path Coefficients (variable PPC) was not used. The Applicant is requested to provide an explanation for the deviation.		
4.2.2: Background Ozone	Applicant used non-EPA default value for background ozone (variable BCKO3). Applicant used a background value of 40 ppb (default = 80 ppb). The Applicant is requested to provide an explanation for the deviation.		
4.2.2: Stack Exit Velocities	The Applicant is requested to explain their methodology for the treatment of horizontal stacks (Source ID: S11-1 to S11-8, S11-12 to S11-15, and S11-17 to S11-25) within CALPUFF.		
4.2.2: Stack Diameters	The stack diameters for sources S11-20 to S11-25 are set to 0.001 m in the model, but are listed as 0.1 m in the report. The Applicant is requested to explain the discrepancy.		
4.2.2: Emission Rates	Emission rates for sources S11-1 to S11-25 do not match the calculated emission rates listed in report. The Applicant is requested to explain the discrepancy.		
4.2.2: BPIP	The Applicant has invoked BPIP-Prime building downwash, which is not the EPA default method. The Applicant is requested to provide an explanation for the deviation.		
4.2.2: Discrete Receptor Settings	The Applicant does not have CALPOST set to select all discrete receptors (variable NDRECP). The Applicant is requested to provide an explanation for the deviation.		
4.2.2: NO ₂ /NO _x Ratio	The Applicant used the new EPA regulatory version of CALPOST, but did not use EPA default input values for NO ₂ /NO _x ratio calculation. The Applicant is requested to provide an explanation for the deviation.		
4.2.2: POSTUTIL Version	The Applicant has used the non-EPA approved version of POSTUTIL (v. 1.641). The Applicant is requested to provide an explanation for the deviation.		

ATTACHMENT A

**Production Rates
(1 page)**

MONTHLY PRODUCTION RATES

Monthly production rates have been provided in the table below. The monthly production rates were calculated based on the annual production rates.

Table A-1: Process Production Rates

Year	Drums Produced	Drums/Day	Drums/Month
2005	294,148	1,177	24,512
2006	334,791	1,339	27,899
2007	355,256	1,421	29,605
2008	259,302	1,310	21,609
2009	187,438	1,258	15,620
2010	202,337	1,176	16,861
2011	262,591	1,050	21,883
2012	276,082	1,104	23,007
Average	271,493	1,229	22,624
Maximum	400,000	1,600	33,333

ATTACHMENT B

**Calculations
(4 pages)**

CONTAMINANT EMISSION RATES

1. Provide rationale/source for paint usage and lining usage listed in Table D.11.

External Coating Line

The maximum quantity of paint used is 45 gallons per 1250 drums, at a production rate of 300 drums/hr.

$$\begin{aligned} \text{Usage} &= 45 \text{ gal} / 1250 \text{ drums} \times 3.785 \text{ L/gal} \times 300 \text{ drums/hr} \\ &= 40.9 \text{ L/hr} \end{aligned}$$

Internal Coating Line

The maximum paint usage is 45 gallons per 1200 drums, at a production rate of 300 drums/hr.

$$\begin{aligned} \text{Usage} &= 45 \text{ gal} / 1200 \text{ drums} \times 3.785 \text{ L/gal} \times 300 \text{ drums/hr} \\ &= 42.6 \text{ L/hr} \end{aligned}$$

Drum tops/bottoms

The coating is completed in a paint spray booth with a maximum production rate of 1000 parts (tops or bottoms) per hour. The maximum paint or lining usage is 45 litres per hour. This hourly rate was adjusted to account for the fact that the facility will not create more parts than drums over a year.

$$\begin{aligned} \text{Usage} &= 45 \text{ L/hr} \times (600 \text{ parts}/1000 \text{ parts}) \\ &= 27 \text{ L/hr} \end{aligned}$$

Paint Touch-up

The maximum paint usage is 4 L/hr with a production rate of 300 drums/hr.

2) Provide sample calculation to indicate how emissions in Table 4 were obtained (i.e. how were the calculations in Attachment D combined to provide the numbers in Table 4).

Sample Calculation for VOC Annual Average Emissions from Point Source S1-14 (Paint Spray Booth)

Table B-1: VOC Annual Average Emissions for Various Sources

Source	VOC Annual Average Emissions (kg/year)	Report Reference
Combustion	31	Table D.1
Painting	7,828	Table D.3
Lining	13,128	Table D.5
Fugitives	426	Table D.9
Total	21,412	

Table B-2: Emissions Distribution for S1-14 (Paint Spray Booth)

Source	Percent of Total Emissions (%)	Report Reference
Combustion	0	Table D.10
Painting	33.1	Table D.11
Lining	0	Table D.11
Fugitives	11	Table D.12

Combustion Emissions

= Combustion Emissions (kg/yr) x S1-14 Combustion Distribution (%)
 = 31 x 0%
 = 0 kg/yr

Painting Emissions

= Painting Emissions (kg/yr) x S1-14 Painting Distribution (%)
 = 7828 x 33.1%
 = 2591 kg/yr

Lining Emissions

= Lining Emissions (kg/yr) x S1-14 Lining Distribution (%)
 = 13128 x 0%
 = 0 kg/yr

Fugitives Emissions

= Fugitives Emissions (kg/yr) x S1-14 Fugitives Distribution (%)
 = 426 x 11%
 = 47 kg/yr

Facility Annual Average VOC Emissions from S1-14

= Combustion + Painting + Lining + Fugitives
 = 0 kg/yr + 2591 kg/yr + 0 kg/yr + 47 kg/yr
 = 2638 kg/yr

3. Despite information provided, “VOCs Per Year” and “Particulate Per Year” numbers in Table D.7 cannot be replicated. Please provide sample calculation. In particular, discrepancies appear to be evident for Silk Screens #4 to #6.

Sample Calculation for Silk Screen #5

2012 Purchased: 0.0241 Gallons x 3.7854 L/gal
 = 0.091 L
Paint Density: 1.49 kg/L
VOC Content: 4.25 lbs/Gallon
Volatile by Weight: 50%
Solids Content = Paint Density (kg/L) x (100% - Volatile by Weight %)
 = 1.49 kg/L x (100% – 50%)
 = 0.745 kg/L

2012 VOC Emissions

= VOC Content of Paint (lbs/gal) x 2012 purchased (L/yr) x Conversion lb to kg
= 4.25 lbs/gal x 0.091 L/yr x 0.454 kg/lb / 3.7854 L/gal
= 0.047 kg / yr

2012 Particulate Emissions

= Solids Content of Paint (kg/L) x 2012 Purchased (L/yr)
= 0.745 kg/L x 0.091 L/yr
= 0.068 kg / yr

Table B-3: Silk Screening Emissions

Item Number	Greif ID	Description	Density (kg/L)	2012 Purchased (Gallons)	VOC Content (%bw)	Solids Content (%bw)	Material VOC Content (lbs/gallon)	Material Solids Content (kg/L)	Purchased (L)	Material VOC Content (kg/L)	VOCs Per Year (kg)	Particulate Per Year (kg)

**Re: Response to HPAQB CALPUFF Model Oakville Facility Report Peer Review Comments
Novus File No. 12-0203**

Dear Ainslie Murdock:

Novus Environmental Inc. (Novus) is pleased to provide the following summary response to the comments from the reviewer, for the HPAQB facility located in Oakville, Ontario.

1.0 Summary of Response:

Specific to All CALPUFF Runs

Application Item 4.2: BPIP Input File Not provided:

The Applicant did not provide the associated BPIP input files for all model runs. Without the BPIP input file, the model characterization of all Facility buildings cannot be verified. The Applicant is requested to provide this information so that their modelling can be fully evaluated.

[BPIP file will be provided.](#)

Application Item 4.2.2: Model Grid Size:

The Applicant used EPA default 25x25 grid, 4 km grid size, instead of Town default 100x100 grid, 1 km grid size. The Applicant is requested to provide an explanation for the deviation.

[Modelling grid size was based on the provided meteorological CALMET file at 25x25 4km grids. The CALPUFF modelling grid by default should be the same as meteorological data grid. We cannot perform 100x100 1km CALPUFF unless receiving the CALMET data at the same grid resolution. However the desecrated sampling grid has been at higher resolution \(~ 1km\) as provided by the Town of Oakville.](#)

Application Item 4.2.2: Deposition:

The Applicant did not invoke deposition, which is the EPA default method. The Applicant is requested to provide an explanation for the deviation.

[According to the by-law, there is no requirement of deposition calculation. The EPA default has no impact on the air concentration results. Therefore not to invoke deposition will not result in different CALPUFF modelling results.](#)

[Suggest leave this setting.](#)

Application Item 4.2.2: Ambient Temperature:

The Applicant is requested to explain their methodology of setting the stack temperature at a value of 15°C for stacks exiting at ambient temperature.

Not sure what the question is. The stack exiting temperature is defined in the source parameters; the ambient temperature is derived from CALMET output at the location stack during CALPUFF modelling process on hourly basis. The model should not use the fixed ambient temperature.

Specific to Mesopuff CALPUFF Runs

Application Item 4.2.2: MESOPUFF Chemistry:

Applicant included SO₂ and NO_x in FPM model and invoked the MESOPUFF chemistry module despite not being a major emitter for either contaminant. Analysis of these emissions was not required; since this provides a conservative estimate of air-borne concentrations of FPM, however, the applicant may choose to leave this setting.

Agreed.

Application Item 4.2.2: Wind Speed Profile:

The Rural Wind Speed Profile (variable PLX0) was used instead of the default Urban Wind Speed Profile. The Applicant is requested to provide an explanation for the deviation.

Since dispersion coefficients were internally calculated based on sigma v, sigma w using micrometeorological variables, there is no requirement using wind speed profiles which are only applied to PG stability classes. The variable PLX0 has no effect on the application modelling.

Suggest leave this setting.

Application Item 4.2.2: Plume Path Coefficients:

The default values for the Plume Path Coefficients (variable PPC) was not used. The Applicant is requested to provide an explanation for the deviation.

Studies done by Lott (1984, 1986) suggested using PPC parameters as applied in the CALPUFF model in complex terrain area. As the Town of Oakville is located by Lake Ontario, we suggested that PPC as applied should be more feasible to the local meteorological conditions. However, sensitivity tests indicated the PCC setting had nearly no influence to the model results.

Reference:

Lott, R.A. 1984. Case Study of Plume Dispersion Over Elevated Terrain. Atmospheric Environment 18(1). 125-134 p.

Lott, R.A. 1986. Model Performance – Plume Dispersion Over Elevated Terrain. Atmospheric Environment 20(8). 1547-1554 p.

Application Item 4.2.2: Background Ozone:

Applicant used non-EPA default value for background ozone (variable BCKO3). Applicant used a background value of 40 ppb (default = 80 ppb). The Applicant is requested to provide an explanation for the deviation.

Based on the requirement of by-law, we selected Option 1 “read hourly ozone concentration from the OZONE.DAT data file”, not the monthly defaults in the input file. The default EPA values in the input file have no impact on the modelling results.

Suggest leave this setting.

Application Item 4.2.2: Stack Exit Velocities:

The Applicant is requested to explain their methodology for the treatment of horizontal stacks (Source ID: S11-1 to S11-8, S11-12 to S11-15, and S11-17 to S11-25) within CALPUFF.

Horizontal stacks were modelled with an exit velocity of 0.001 m/s at the actual diameter of 0.1 m. Stacks were modelled with a very low exit velocity to represent the horizontal stacks having no initial vertical momentum.

Application Item 4.2.2: Stack Diameters:

The stack diameters for sources S11-20 to S11-25 are set to 0.001 m in the model, but are listed as 0.1 m in the report. The Applicant is requested to explain the discrepancy.

There were typos in the modelling settings, however, this discrepancy will not significantly change the results as there is still no vertical momentum being modelled, which is what we are trying to model for the horizontal stacks. Re-modelling is performed to fix the typos in Section 2.0.

Application Item 4.2.2: Emission Rates:

Emission rates for sources S11-1 to S11-25 do not match the calculated emission rates listed in report. The Applicant is requested to explain the discrepancy.

This is a typo in the input file. Re-modelling is performed to fix the typos in Section 2.0.

Specific to SOA CALPUFF Runs

Application Item 4.2.2: BPIP:

The Applicant has invoked BPIP-Prime building downwash, which is not the EPA default method. The Applicant is requested to provide an explanation for the deviation.

We used the PRIME method for BPIP rather than the default ISC method. Based on our experience, PRIME method always gives more accurate yet conservative results than ISC method. Re-modelling is performed to use EPA default ISC method in Section 2.0.

Questions Specific to CALPOST

Application Item 4.2.2: Discrete Receptor Settings:

The Applicant does not have CALPOST set to select all discrete receptors (variable NDRECP). The Applicant is requested to provide an explanation for the deviation.

There was a shorter selection in receptors along the boundary (less 100 receptors). This shortage has no impact on the results. Re-modelling is performed to fix the typos in Section 2.0.

Application Item 4.2.2: NO₂/NO_x Ratio:

The Applicant used the new EPA regulatory version of CALPOST, but did not use EPA default input values for NO₂/NO_x ratio calculation. The Applicant is requested to provide an explanation for the deviation.

As we applied NO2CALC=0 that means we directly use NO₂ from CALPUFF output. Hence the NO₂/NO_x ratio is irrelevant to the CALPOST results.

Suggest leave this setting.

Questions Specific to POSTUTIL

Application Item 4.2.2: POSTUTIL Version:

The Applicant has used the non-EPA approved version of POSTUTIL (v. 1.641). The Applicant is requested to provide an explanation for the deviation.

We used the latest POSTUTIL version for the interim post processing. However the output of both old and new versions of POSTUTIL for the output variables were identical for this project. It is not necessary to apply the EPA default POSTUTIL.

2.0 Re-Modelling and Comparison

To clearly reply the questions, we re-ran CALPUFF with following changes in the “New” model settings:

- The stack diameters for sources S11-20 to S11-25 are set to 0.1m
- Fixed emissions rates for sources S11-1 to S11-25
- Changed downwash method to ISC (EPA default)
- Fixed CALPOST receptors

Table 1 provides the summary of comparison in FPM concentrations between the original model runs and the new runs. The MTFI value is the maximum total facility induced concentration, and the MC is the maximum cumulative concentration of the facility emissions and background concentrations. The 3rd rank of the annual mean FPM concentrations over the five years of meteorological data used is presented for the average (annual) emissions. The highest annual FPM concentration over the five years of meteorological data is presented for the maximal (annual) emissions.

Table 1: Summarized Comparison of FPM Concentrations between Original and the New Runs

	Average Emissions Concentration ($\mu\text{g}/\text{m}^3$)		Maximal Emissions Concentration ($\mu\text{g}/\text{m}^3$)	
	MTFI	MC	MTFI	MC
Orig. Annual Value	0.08	7.65	0.19	9.1
New Annual Value	0.04	7.59	0.06	7.61
Difference %	-50%	-0.8%	-68%	-16.3%

Table 1 indicates that, the new runs predicted lower FPM concentrations than the original runs at MRFI (facility only contributions) and MC (cumulative). Overall, the original modeling predicted more conservative results mainly due to the fact of applying PRIME downwash method.

3.0 Conclusions

Because the original modeling predicted conservative results (Table 1), along with the explanation in Section 1, it should not be necessary to revise the conclusion of modelling report in the submission. We suggest that this technical report and additional runs output can be supplied as an amendment to the original report. We also suggest no change in contour plots.
