Executive Summary

GHD Limited (GHD) was retained by South Service Holding Corp. (Client) to prepare a Noise and Vibration Impact Study (Study) for the proposed residential development (Development) located at 420-468 South Service Road East, Oakville, Ontario (Site). This Study has been prepared in support of the planning approvals for the Development.

The Site is bounded by South Service Road and the QEW to the northwest, the Oakville GO Subdivision Rail Line to the southeast, with existing light industrial / commercial properties to the northeast and southwest. The Development includes 14 high-rise residential towers ranging from 35 to 48 storeys tall, with ten six-storey podiums at the bases of the towers. There are publicly accessible parks planned for central areas of each block.

The purpose of this Study is to assess the following potential impacts:

– Noise impacts at the Development due to future projected road traffic
– Stationary noise impacts from off-site industrial/commercial facilities
– Stationary noise impacts to the Development and surroundings from on-site equipment
– Ground-borne vibration impacts due to rail traffic

Future predicted noise levels at the Development from road traffic on the nearby major roadways are sufficiently high that noise mitigation is required in the form of building envelope sound transmission class (STC) specifications, acoustic barriers, and central air conditioning. Noise warning clauses are also recommended.

Cumulative stationary noise levels at the Site from nearby industrial and commercial facilities are within the applicable stationary noise limits of the MECP. The Development is not predicted to impact the ability of the nearby commercial or industrial facilities to comply with the sound level limits of NPC-300.

According to the “Guidelines for New Development in Proximity to Railway Operations, May 2013” (GNDPRO), if the proposed dwelling units are located more than 75 m from the railway right-of-way, vibration measurements are not required. The nearest proposed buildings of the Development are approximately 120 metres from the right-of-way of the CN Oakville Subdivision rail line; therefore, vibration measurements are not required.

This report is subject to, and must be read in conjunction with, the limitations set out in section 1.3 and the assumptions and qualifications contained throughout the Report.

1. Introduction

1.1 Purpose of this Report

GHD Limited (GHD) was retained by South Service Holding Corp. (Client) to prepare a Noise and Vibration Impact Study (Study) for the proposed high-rise residential Development (Development) located at 420-468 South Service Road East, Oakville, Ontario (Site). This Study has been prepared in support of the planning applications for the Development in accordance with the following guidelines:

– Ontario Ministry of Environment, Conservation and Parks (MECP) guideline NPC-300 “Environmental Noise Guideline: Stationary and Transportation Sources – Approval and Planning” (2013)
– Federation of Canadian Municipalities (FCM) & The Railway Association of Canada (RAC) document entitled "Guidelines for New Development in Proximity to Railway Operations, May 2013"
– Halton Region Regional Official Plan Guidelines “Noise Abatement Guidelines (2014)

1.2 Site and Development Description

The Site is located at 420-468 South Service Road East, Oakville, Ontario, approximately 210 metres northeast of Trafalgar Road and approximately 15 metres southeast of the QEW. The GO Transit Oakville Subdivision Rail Line runs approximately 90 metres southeast from the Site. A key plan is included as Figure 1.1, which shows the location of the Site in relation to these transportation corridors.

The Site is currently zoned as Employment (6T-32T-MTE). The lands surrounding the Site predominantly include properties zoned as Employment (MTE, E1, E2), Commercial (C2, C3, MTC, E4), and Utility (U) in all cardinal directions, Residential to the northwest and southeast and a few additional zoning categories dispersed around a one-kilometre radius around the Site (including designations such as: Future Development, Community Use, Institutional, Natural Area, and Park). A zoning map is included in Figure A.1 of Appendix A.

The area surrounding the Site is relatively flat apart from a few bridge features (for instance, the Trafalgar Road bridge over the QEW), and there are several intervening structures that obstruct the line of sight to the roadways, particularly at the lower floors.

GHD conducted a site visit on September 27, 2024, to record observations regarding significant sources of noise and vibration in the area surrounding the Development. GHD observed that sound levels at the site were generally dominated by noise from Highway 403/QEW, and noise/vibration from off-site industrial activity was not audible/perceptible during the site visit.

The Development consists of 14 high-rise residential towers ranging from 35 to 48 storeys tall, with ten podiums at the bases of the towers all at six storeys tall. There are publicly accessible parks planned for central areas of each block. Locations of outdoor amenities are not known at this time but are expected to be provided at grade and/or on the roofs of the podiums. The Development Concept Plan is provided in Appendix A for reference.

1.3 Scope and Limitations

This report: has been prepared by GHD for South Service Holding Corp. and may only be used and relied on by South Service Holding Corp. for the purpose agreed between GHD and South Service Holding Corp. as set out in section 1.1 of this report.

GHD otherwise disclaims responsibility to any person other than South Service Holding Corp. arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

2. Sound and Vibration Criteria

2.1 Halton Region Noise Abatement Guidelines

Halton Region's Noise Abatement Guidelines (HRNAG) were reviewed in the context of this Study. The HRNAG provides information on the requirements for mitigation. Section 4.0 of the HRNAG, which addresses new developments, states that developer will be required to abate noise originating from traffic, industrial and commercial plazas, and/or other noise sources which exceed the Ministry of the Environment (since renamed the Ministry of Environment, Conservation and Parks) guidelines. The relevant noise guidelines and criteria of the Ministry of Environment, Conservation and Parks (MECP) are summarized in Section 2.2 and 2.3 of this Study.

2.2 Road and Rail Traffic Criteria

Under NPC-300, road and rail traffic noise impacts are evaluated separately for exterior receptors and interior receptors based on the average day (07:00 to 23:00) and night (23:00 to 07:00) noise impacts. The sound levels are expressed in terms of A-weighted equivalent sound levels (Leq).

NPC-300 defines two categories of receivers for transportation noise:

– Plane of Window (POW): Point corresponding with the centre of a window of a sensitive space.
– Outdoor Living Area (OLA): Outdoor location intended and designed for quiet enjoyment of the outdoor environment that is readily accessible from the building (e.g., backyards, front yards, gardens, terraces, patios). Private balconies and terraces are only considered OLAs if they are greater than 4 metres in depth and if they are the only outdoor living area for the occupant(s).

NPC-300 specifies sound level limits for POW and OLA receivers as summarized in Table 2.1 below.

Table 2.1 Road Traffic – Outdoor Sound Level Limits

Receiver Category	Sound Level Limit (dBA)	
	Day (16-hour Leq)	Night (8-hour Leq)
Plane-of-Window (POW)	55	50
Outdoor Living Area (OLA)	55	N/A

For POWs, combined road and rail traffic sound levels exceeding the corresponding criteria above would require additional controls for MECP compliance. Depending on the magnitude of the exceedances, additional controls may include ventilation requirements, requirements for building envelope elements, and/or noise warning clauses. For sound levels greater than 55 dBA and less than or equal to 65 dBA during the day or greater than 50 dBA and less than or equal to 60 dBA during the night, the building should be designed with a provision for the installation of central air conditioning in the future, at the occupant's discretion with the inclusion of warning clause Type C. If the sound levels are greater than 65 dBA during the day or greater than 60 dBA at night, installation of central air conditioning should be implemented with the inclusion of warning clause Type D.

For OLAs, road traffic sound levels exceeding the daytime limit indicated above would require design of noise barriers to achieve the target, and/or warning clauses. NPC-300 states that sound levels up to 5 dBA above the OLA sound level limit (i.e., up to 60 dBA) are acceptable with the use of an appropriate noise warning clause.

If POW sound levels from future road traffic exceed 65 dBA during the day or 60 dBA at night, or if sound levels from future rail traffic exceed 60 dBA during the day or 55 dBA at night, building envelope components must be designed to achieve the indoor sound level limits of NPC-300. The indoor sound level limits for road and rail traffic are summarized in Table 2.2 below.

Table 2.2 Road and Rail Traffic – Indoor Sound Level Limits (Residential uses)

Receiver Category	Road Sound Level Limits (dBA)		Rail Sound Level Limits (dBA)	
	Day (16-hour Leq)	Night (8-hour Leq)	Day (16-hour Leq)	Night (8-hour Leq)
Indoor living areas (excluding sleeping quarters)	45	45	40	40
Sleeping quarters	45	40	40	35

NPC-300 includes supplementary road traffic indoor sound level limits for non-residential sensitive land uses, which are summarized in Table 2.3 below.

Table 2.3 Road and Rail Traffic – Indoor Sound Level Limits (Non-Residential uses)

Receiver Category	Road Sound Level Limits (dBA)		Rail Sound Level Limits (dBA)	
	Day (16-hour Leq)	Night (8-hour Leq)	Day (16-hour Leq)	Night (8-hour Leq)
General offices, reception areas, retail stores, etc.	50	-	45	-
Hospitals, schools, nursing/retirement homes, daycare centres, theatres, places of worship, libraries, individual or semi-private offices, conference rooms, reading rooms, etc.	45	-	40	-
Sleeping quarters of hotels/motels	-	45	-	40
Sleeping quarters of hospitals, nursing/retirement homes, etc.	-	40	-	35

2.3 Stationary Noise Limits

2.3.1 MECP Standard Limits

NPC-300 defines stationary noise sources as sound from all sources that are normally operated within the property lines of a facility. The noise impact from stationary sources is evaluated based on operations during a predictable worst-case hour. Stationary noise assessment criteria are generally determined based on the MECP's minimum exclusionary sound level limits, as presented in NPC-300, in comparison to the background sound levels experienced in the area.

The Site is in what would generally be considered a Class 1 acoustic environment as defined by NPC-300, as the acoustic environment is dominated by human activities (i.e., road traffic). Since the day and evening sound limits are equivalent in a Class 1 area, the day and evening periods are consolidated into a single day period from 7 am to 11 pm.

Table 2.4 below summarizes the MECP's minimum exclusionary sound level limits for Class 1 areas, which are expressed in terms of 1-hour equivalent sound levels (1-hour Leq):

Table 2.4 MECP Minimum Exclusionary Sound Level Limits for Steady Sound – Class 1 Area

Point of Reception Type	Sound Level Limits (dBA)	
	Day (7am – 11pm)	Night (11pm – 7am)
Plane of window	50	45
Outdoor space	50	--

Impulse noise sources are evaluated separately from steady noise sources. However, no significant impulse noise sources were identified during field review; therefore, an impulse noise assessment is not considered warranted.

2.3.2 Background Sound Levels

GHD conducted a background sound level assessment to evaluate the existing background noise due to road traffic on the QEW, Trafalgar Road, Cornwall Road, and South Service Road East. Background noise was modelled in CadnaA, which was set to predict noise emission rates in accordance with the United States of America's (US) Department of Transportation's Traffic Noise Model (TNM). These noise emissions were validated with STAMSON, the MECP's computerized model of the Ontario Road Noise Analysis Method for Environment and Transportation (ORNAMENT). The applicable noise criteria at a point of reception are based on the higher of the background sound level and the MECP's minimum sound level limits, as noted in Section 2.2.1.

The computer model input parameters include, among other data, the number of road segments, number of house rows, the positional relationship of the receptor to a noise source or barrier in terms of distance, elevation and angle, the basic site topography, the ground surface type, traffic volumes, traffic composition, and speed limit.

Hourly traffic counts from 2019 for the QEW (Highway 403) were obtained from the Ontario Ministry of Transportation. Additionally, TMC data was obtained from Halton Region. These counts were used to determine the minimum hourly count during the day and nighttime periods based on a published typical hourly traffic distribution for noise modelling (VanDelden et al, 2008).

Table 2.5 Background Road Traffic Parameters

Road Segment	Minimum Hourly Daytime Vehicles	Minimum Hourly Nighttime Vehicles	Commercial Vehicle Rates (medium trucks / heavy trucks)
QEW	4228	951	5% / 15%
Trafalgar Road (60km/h)	523	42	0% / 2%
Trafalgar Road (50km/h)	523	42	0% / 2%
South Service Road East	104	8	0% / 1%
Cornwall Road	411	33	0% / 4%

The above road traffic data was used to calculate background sound levels at the façades and outdoor points of reception of the Development using the detailed model methodology described in Section 3.1 of this Study. Predicted noise levels exceed the Class 1 exclusionary limits at the worst-case facades of the development. Figure 2.1 shows the lowest predicted road traffic sound levels at each of the outer façades and outdoor points of reception of the Development based on the road traffic data summarized above. The lowest sound levels generally occur at the tallest floor level (142.5 metres above grade) and increase towards the lower floors due to closer proximity and increased exposure to the QEW.

Where the predicted background sound level due to road traffic exceeds the corresponding minimum exclusionary sound level limit of NPC-300 (see Table 2.4), the background sound level is instead used as the criteria for

assessment of stationary noise impacts. The applicable site-specific sound level limits for the Development are summarized as follows:

Table 2.6 Applicable Sound Level Limits for Steady Sound

Worst-case Façade / POR ID	Sound Level Limits (dBA)	
	Day (7am – 7pm)	Night (11pm – 7am)
Block 1 – Podium of Tower C	64	55
Block 2 – Podium of Tower H	68	62
Block 3 – Podium of Tower M	66	60
Block 4 – Podium of Tower I	66	60

The applicable guideline sound level limits for regular scheduled testing of emergency equipment (e.g., standby generator) are 5 dBA higher than the corresponding values above.

2.4 Rail Vibration Criteria

The Federation of Canadian Municipalities (FCM) & The Railway Association of Canada (RAC) document entitled "Guidelines for New Development in Proximity to Railway Operations, May 2013" (GNDPRO) contains criteria for assessment of ground-borne vibration due to rail operations. According to the GNDPRO, if the proposed dwelling units of a proposed development are located more than 75 m from the railway right-of-way, vibration measurements are not required. The nearest proposed buildings of the Development are approximately 120 metres from the right-of-way of the CN Oakville Subdivision rail line; therefore, vibration measurements are not required.

3. Transportation Noise Impact Assessment

3.1 Methodology

The roadways near the Site were modelled as line sources in CadnaA using sound power levels determined from STAMSON. The STAMSON generated sound power levels were then applied to equation 36 of the United States of America's (US) Department of Transportation's Traffic Noise Model 3.0 (TNM 3.0) Technical Manual. This equation is used to determine the noise spectra for cars, medium trucks, and heavy trucks depending on road and vehicle conditions. For the purposes of this assessment, average pavement type and vehicles operating at full throttle was assumed.

Rail traffic noise levels are modelled as line sources of sound using the rail source element in CadnaA using the US Federal Transit Administration and Federal Railway Administration's prediction algorithm (FTA/FRA Model). The rail noise sources were set to use noise emission rates calculated using STAMSON.

The 3D CadnaA model accounts for the complex geometry at the Site and the surrounding area. The area surrounding the Site features significant elevation changes near the highway ramps, which have been captured in the model using ground elevation data from the Development Concept (Appendix A) and the area surrounding the Site obtained from Region of Halton Open Data. Road traffic noise levels were predicted at all POWs of the Development using the Building Noise Map feature of CadnaA, and at OLAs using point receivers.

To demonstrate that the model is generally consistent with the STAMSON model that is the standard in Ontario, a sample STAMSON calculation is included in Appendix B representing a northwest façade of the podium of Tower A, 19.5 metres above grade (m A.G.). The prediction results are within ± 1 dBA of the CadnaA noise predictions, indicating that the CadnaA model is consistent with STAMSON. Appendix B also includes Figure B.1 which displays the sample calculation locations for ease of reference.

3.2 Traffic Input Parameters

3.2.1 Road Traffic Data

Future road traffic model parameters used in this Study is summarized as follows:

Table 3.1 Future (2035) Road Traffic Input Parameters

Road Segment	Future AADT	Speed Limit (km/h)	Day / Night Split	Commercial Vehicle Rates (medium trucks / heavy trucks)
QEW	254,812	100	85% / 15%	5% / 15%
Trafalgar Road (60km/h)	55,000	60	90% / 10%	0% / 2%
Trafalgar Road (50km/h)	55,000	50	90% / 10%	0% / 2%
South Service Road East	5,469	60	90% / 10%	0% / 1%
Cornwall Road	21,566	60	90% / 10%	0% / 4%
North Service Road East	11,350	60	90% / 10%	0% / 4%
Chartwell Road	6,395	50	90% / 10%	0% / 4%

Road traffic volumes for the QEW were obtained from data published by the Ontario Ministry of Transportation (MTO) in the form of Summer Average Daily Traffic (SADT) volumes for the year 2021 (SADT is used because it is higher than the AADT in this case). Based on the MTO's published data, the average annual SADT growth rate from 2015 to 2021 was 0.49%, which was used to forecast the volumes to 2035. The day / night split and commercial vehicle rates were calculated based on the hourly traffic counts.

Road traffic volumes for South Service Road East, and Cornwall Road were obtained from the Region of Halton in the form of Turning Movement Counts (TMC) for the year 2024. Traffic data for Trafalgar Road was obtained as ultimate traffic volumes. GHD applied an assumed growth rate of 2.5% to the TMC data to estimate the future 2035 AADT. A day / night split of 90% / 10% was assumed. Commercial vehicle rates were determined based on the TMC reports. AADT values were estimated from the TMC counts based on guidance from the Ontario Traffic Manual.

Road traffic volumes for North Service Road East and Chartwell Road were obtained from the Town of Oakville open data in the form of AADT volumes for the year 2018. GHD applied an assumed growth rate of 2.5% to estimate the future 2035 AADT. A day / night split of 90% / 10% was assumed. Commercial vehicle rates were conservatively assumed to be equal to those of Cornwall Road.

Figure 1.1 shows the location of the roadways noted above in relation to the Site. All road traffic data referenced in this Study is included in Appendix C.

3.2.2 Rail Traffic Data

Future rail traffic model parameters used in this Study are summarized as follows:

Table 3.2 Future (2035) Rail Traffic Input Parameters

Rail Source	Future Daytime Trains	Future Nighttime Trains	Locomotive Type	Max. Locomotives per Train	Max. Cars per Train	Max. Speed (km/h)
CN Rail – Oakville Subdivision (Way Freight)	4	5	Diesel	4	25	97
Via Rail – Oakville Subdivision	18	0	Diesel	2	10	153
GO Rail – Oakville Subdivision	354	54	Diesel	1	10	153

Rail traffic data for CN freight, way freight, and VIA Rail passenger traffic operating on the GO Rail Line - Oakville Subdivision was obtained from Canadian National (CN) railway. Future rail volumes for these rail traffic sources were estimated using an assumed annual growth rate of 2.5%.

Future 2035 forecast rail traffic data for the GO Rail Line traffic operating on the Oakville Subdivision was obtained from Metrolinx. As per Metrolinx's recommendations, despite the planned future electrification of GO trains on the Oakville Subdivision, all locomotives were modelled as diesel locomotives.

Figure 1.1 shows the location of the rail line noted above in relation to the Site. All rail traffic data referenced in this Study is included in Appendix C.

3.3 Road and Rail Traffic Results

3.3.1 Plane of Window Receivers

Predicted future road and rail traffic noise impacts at the worst-case POW receivers of the Development are summarized as follows:

Table 3.3 Future Road and Rail Noise Levels – Plane of Window

Building	Façade	Future Noise Levels (dBA)						Limits Exceeded?
		Road		Rail		Total		
		Day	Night	Day	Night	Day	Night

	Southeast	65	61	70	65	71	66	Yes
	Southwest	69	65	68	63	72	67	Yes
	Northwest	73	68	62	57	73	68	Yes
Tower N	Northeast	71	66	70	66	74	69	Yes
	Southeast	58	53	73	68	73	68	Yes
	Southwest	67	62	70	66	72	67	Yes
	Northwest	71	67	63	58	72	68	Yes

Building	Façade	Future Noise Levels (dBA)						Limits Exceeded?
		Road		Rail		Total		
		Day	Night	Day	Night	Day	Night	
Podium of Towers M and N	Northeast	72	68	68	63	73	69	Yes
	Southeast	60	55	69	64	70	65	Yes
	Southwest	67	63	67	62	70	66	Yes
	Northwest	72	67	63	58	73	68	Yes

As seen above, future road and rail noise levels at the façades generally range from 67 dBA to 83 dBA during the day and 62 dBA to 78 dBA at night. These sound levels are sufficiently high that the Development must incorporate physical noise mitigation and noise warning clauses in accordance with NPC-300, which are described further in Section 3.4. Figure 3.1 shows the predicted road noise levels at the façades throughout the Development.

3.3.2 Outdoor Living Areas

The design of the Development is preliminary, and specific locations for outdoor amenity spaces are not yet known. It is expected that outdoor amenity spaces would be located at grade or on the roofs of the podiums. Tables 3.4 through 3.6 present the predicted cumulative road and rail noise levels at various potential outdoor amenity space locations.

Predicted future road traffic noise impacts at the worst-case OLA receivers of the Development are summarized as follows:

Table 3.4 Cumulative Road and Rail Noise Levels – Outdoor Living Areas (Block 1)

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-01a	Potential Block 1 outdoor amenity space located at grade (1.5 metres above grade [m AG])	61	55	Likely feasible with acoustic barrier and warning clause Type B
OLA-01b	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	69	55	Potentially feasible with tiered podium to provide acoustic screening, with warning clause Type B
OLA-01c	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	73	55	Unlikely feasible
OLA-01d	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	78	55	Unlikely feasible
OLA-01e	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	68	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-01f	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	70	55	Unlikely feasible
OLA-01g	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	69	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-01h	Potential Block 1 outdoor amenity space located on podium roof (19.5 m AG)	74	55	Unlikely feasible

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-01i	Potential Block 1 outdoor amenity space located on roof of Tower A (136.5 m AG)	65	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-01j	Potential Block 1 outdoor amenity space located on roof of Tower B (145.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-01k	Potential Block 1 outdoor amenity space located on roof of Tower D (136.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-01l	Potential Block 1 outdoor amenity space located on roof of Tower C (121.5 m AG)	65	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B

Table 3.5 Cumulative Road and Rail Noise Levels – Outdoor Living Areas (Block 2)

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-02a	Potential Block 2 outdoor amenity space located at grade (1.5 metres above grade [m AG])	61	55	Likely feasible with acoustic barrier and warning clause Type B
OLA-02b	Potential Block 2 outdoor amenity space located on podium roof (19.5 m AG)	72	55	Unlikely feasible
OLA-02c	Potential Block 2 outdoor amenity space located on podium roof (19.5 m AG)	77	55	Unlikely feasible
OLA-02d	Potential Block 2 outdoor amenity space located on podium roof (19.5 m AG)	70	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-02e	Potential Block 2 outdoor amenity space located on podium (19.5 m AG)	68	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-02f	Potential Block 2 outdoor amenity space located on podium (19.5 m AG)	78	55	Unlikely feasible

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-02g	Potential Block 2 outdoor amenity space located on roof of Tower F (145.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-02h	Potential Block 2 outdoor amenity space located on roof of Tower G (136.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-02i	Potential Block 2 outdoor amenity space located on roof of Tower H (121.5 m AG)	65	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-02j	Potential Block 2 outdoor amenity space located on roof of Tower E (136.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B

Table 3.6 Cumulative Road and Rail Noise Levels – Outdoor Living Areas (Block 3)

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-03a	Potential Block 3 outdoor amenity space located at grade (1.5 metres above grade [m AG])	66	55	Likely feasible with acoustic barrier and warning clause Type B
OLA-03b	Potential Block 3 outdoor amenity space located on podium (19.5 m AG)	70	55	Unlikely feasible
OLA-03c	Potential Block 3 outdoor amenity space located on podium (19.5 m AG)	69	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-03d	Potential Block 3 outdoor amenity space located on podium (19.5 m AG)	69	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-03e	Potential Block 3 outdoor amenity space located on podium (19.5 m AG)	68	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-03f	Potential Block 3 outdoor amenity space located on roof of Tower J (106.5 m AG)	65	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-03g	Potential Block 3 outdoor amenity space located on roof of Tower I (121.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-03h	Potential Block 3 outdoor amenity space located on roof of Tower K (136.5 m AG)	63	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B

Table 3.7 Cumulative Road and Rail Noise Levels – Outdoor Living Areas (Block 4)

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-04a	Potential Block 4 outdoor amenity space located at grade (1.5 metres above grade [m AG])	66	55	Likely feasible with acoustic barrier and warning clause Type B
OLA-04b	Potential Block 4 outdoor amenity space located at grade (1.5 m AG)	69	55	Likely feasible with acoustic barrier and warning clause Type B
OLA-04c	Potential Block 4 outdoor amenity space located on podium (19.5 m AG)	67	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-04d	Potential Block 4 outdoor amenity space located on podium (19.5 m AG)	68	55	Potentially feasible with tiered podium to provide acoustic screening of QEW, with warning clause Type B
OLA-04e	Potential Block 4 outdoor amenity space located on podium (19.5 m AG)	73	55	Unlikely feasible
OLA-04f	Potential Block 4 outdoor amenity space located on podium (19.5 m AG)	70	55	Unlikely feasible
OLA-04g	Potential Block 4 outdoor amenity space located on roof of Tower L (136.5 m AG)	63	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B

Receiver ID	Receiver Description	Cumulative Road and Rail Daytime Noise Level (dBA)	Daytime Sound Level Limit (dBA)	Mitigation / Warning Clause Requirements
OLA-04h	Potential Block 4 outdoor amenity space located on roof of Tower M (121.5 m AG)	64	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B
OLA-04i	Potential Block 4 outdoor amenity space located on roof of Tower N (106.5 m AG)	65	55	Likely feasible with amenity space located southeast of mechanical penthouse plus acoustic barriers and warning clause Type B

As seen above, the daytime road noise levels at the OLAs range from 60 dBA to 78 dBA. Noise levels at all OLAs are sufficiently high that physical noise mitigation and/or noise warning clauses are required, which are described further in Section 5. OLA receiver locations are shown in Figure 3.2.

3.4 Transportation Noise Mitigation

3.4.1 Building Envelope Construction

Predicted future traffic noise levels are sufficiently high that the building envelope must be designed with sufficient sound insulation performance to achieve the sound level criteria of NPC-300 for indoor living spaces. Sound insulation performance for windows and walls are commonly specified in terms of Sound Transmission Class (STC) ratings. Higher STC ratings generally correspond to higher sound insulation performance.

STC rating requirements are dependent on the exterior noise levels, source type/spectrum, angles of incidence, sizes of façade components relative to the room size, and sound absorption characteristics of the subject indoor living space. Using these variables, STC rating requirements can be calculated using the method described in the National Research Council Canada's "Controlling Sound Transmission into Buildings" (BPN 56) publication. In accordance with NPC-300, STC rating requirements are calculated separately for road, rail, and air traffic noise, and are then combined on a logarithmic energy sum basis.

Given the preliminary nature of the design of the Development, detailed floor plans and building elevations are not yet available. Therefore, minimum STC rating requirements have been calculated based on assumed window-to-floor area ratios (i.e., total window area for a room divided by its floor area) summarized below:

Table 3.8 Assumed Window-to-Floor Areas

Room Type	Fixed Glazing	Operable Windows	Exterior Doors	Total
Sleeping quarters	43%	7%	--	50%
Other living spaces	20%	2%	8%	30%

Note that if the total actual window-to-floor area ratios are determined to exceed these values during detailed design, then window STC rating requirements would require an updated assessment to ensure acceptable indoor noise levels.

STC rating requirements are significantly affected by window-to-floor area ratios and phasing of the towers; therefore, the STC rating requirements should be updated based on the detailed floor plans and elevations for each building prior to tendering exterior glazing.

3.4.1.1 Exterior Glazing

Road traffic sound levels at the facades of the Development vary significantly, with the highest road traffic sound levels at the northwest façades closest to the QEW. Accordingly, exterior glazing STC requirements vary throughout the Development, as shown in Figure 3.3, with minimum rating requirements ranging from STC-33 to STC-42 based on the assumptions stated above. STC performance in these ranges can be achieved with commercially available glazing assemblies from established glazing suppliers. Examples of glazing assemblies capable of achieving the necessary performance are included in Table 3.7 below:

Table 3.9 Example Window Assemblies and STC Ratings

Minimum STC Rating Requirement			Glazing Assembly Short Form	Glazing Assembly Description
Fixed Glazing	Operable Windows	Exterior Doors		
STC-33	STC-32	STC-32	6-25AS-6	Two 6 mm thick monolithic glass panes separated by an air gap of 25 mm
STC-36	STC-34	STC-33	6L-13AS-6	One 6 mm thick laminated glass pane and one 6 mm monolithic glass pane separated by an air gap of 1 mm
			8-13AS-6	One 8 mm thick monolithic glass pane and one 6 mm monolithic glass pane separated by an air gap of 13 mm
STC-39	STC-37	STC-36	10-25AS-6	One 10 mm thick monolithic glass pane and one 6 mm monolithic glass pane separated by an air gap of 25 mm
STC-42	STC-39	STC-38	10L-25AS-6	One 10 mm thick laminated glass pane and one 6 mm monolithic glass pane separated by an air gap of 25 mm

STC ratings for windows are dependent on a variety of factors (e.g., frame design, seals, etc.) and can vary significantly between manufacturers. Therefore, the final STC rating requirements for the windows should be included in the specifications, and window suppliers should be required to submit laboratory test data with their shop drawings to demonstrate that the STC requirements will be achieved.

3.4.1.2 Exterior Walls

Figure 3.3 includes minimum STC rating requirements for exterior wall assemblies. The highest of the exterior wall requirements is **STC-53** for the façades closest to the QEW, with lower ratings for façades with less exposure to the QEW. Conventional glass or aluminum spandrel panel, brick veneer, or precast concrete exterior wall assemblies are expected to be sufficient, complete with acoustically insulated furring partitions on the interior side. Other exterior wall assemblies may also be acceptable. Exterior wall assemblies should be reviewed during the detailed design phase to ensure the required STC performance is met.

3.4.2 Ventilation

Predicted future traffic noise levels at the façades of the Development are sufficiently high that central air conditioning is required to be installed prior to occupancy for all residential dwellings. This will allow windows and doors to remain closed to help ensure that the indoor sound level limits of NPC-300 are met. Warning clause **Type D** should also be used for all residential dwellings (wording included in Section 5.2).

3.4.3 Acoustic Barriers

As mentioned in Section 3.3.2, various potential OLA locations have been evaluated. It is generally recommended to select locations for outdoor amenity spaces with maximum shielding from the QEW, such as at-grade locations interior

to each of the Blocks. Some podium-level amenity spaces may also be considered and would likely warrant the construction of acoustic barriers.

It is recommended that an updated traffic noise analysis be completed for each phase of the Development at the Site Plan Application stage, once specific locations for OLAs are known.

4. Stationary Noise Impact Assessment

4.1 Methodology

Detailed assessment of noise impacts from each of the facilities identified in the Land Use Compatibility Study dated October 16, 2025, has been carried out using CadnaA version 2025 MR1 (CadnaA). CadnaA is the industry standard for noise modelling of industrial and commercial facilities and is based on ISO standard 9613 2 “Acoustics – Attenuation of Sound during Propagation Outdoors” (1996). CadnaA modelling assumptions used in this Study include:

– Reflection Order: A maximum reflection order of 2 was used to evaluate indirect noise impact from reflecting surfaces.
– Ground Absorption: The model includes a map of ground absorption coefficients of 0.25 for asphalt surfaces and 1.0 for absorptive areas of grass.
– Receptor Elevation: POR receptor heights were modelled appropriately based on an assumed storey height of 3 m, with POR receptors modelled at the midpoint of the storey (i.e., 1.5 m, 4.5 m, etc.)
– Tonality: No tonal sources were identified.
– Building Surfaces: The buildings are modelled as reflective surfaces.

4.2 Off-Site Stationary Noise Sources

As mentioned in Section 1.2 of this Study, off-site stationary sources of noise were not audible during GHD’s site visit on September 27, 2024. Nevertheless, the following off-site stationary noise sources have been identified as warranting further detailed assessment in the Land Use Compatibility Study prepared by GHD, dated October 16, 2025, and are listed below:

– Safe Management Group Inc.
– Assured Automotive
– Multi-tenant Commercial Building – 482 South Service Road
– Blastaway Cleaning Services

Additionally, GHD submitted a request to CN Proximity to obtain a copy of the noise model for the CN Oakville Yard. CN Proximity advised that CN does not have an acoustic model for the CN Oakville Yard. Further, GHD notes that there are existing residential uses along the south side of Cornwall Road, approximately 115 metres from the CN Oakville Yard. The CN Oakville Yard is significantly closer to these existing points of reception than the Development. Therefore, the CN Oakville Yard is not considered to warrant further assessment.

The following subsections describe noise sources and assumptions used in the stationary noise impact assessment. Noise source locations are identified in Figure 4.1; and source sound level data, operating conditions, and heights are included in Table D.1 of Appendix D.

4.2.1 Tractor Trailers

Heavy trucks are expected to be part of the operations at Assured Automotive, Blastaway Cleaning Services, and 482 South Service Road for shipping and receiving equipment and parts, with speeds and volumes summarized in Table D.1 of Appendix D. The assessment conservatively assumes worst-case hour truck movements would occur

during the same hour and are evaluated cumulatively. Noise emissions from heavy truck movements were modelled using reference sound levels published by the United States Federal Highway Administration.

4.2.2 HVAC Equipment

The majority of the buildings surrounding the Site utilize roof-mounted heating, ventilation, and air conditioning (HVAC) equipment. GHD modelled these sources using representative sound data for similar HVAC units. These units are conservatively modelled to operate continuously during the day and evening, and on a 50% duty cycle at night (30 minutes per hour).

4.2.3 Automotive Service

The automotive service facility (Assured Automotive) southwest of the site performs service/maintenance work on automobiles. Based on GHD's experience, the primary sources of noise emissions associated with service activities at these facilities are periodic operations of pneumatic impact wrenches. GHD modelled this source using representative sound data for pneumatic impact wrenches from GHD's past projects. Pneumatic impact wrenches are quasi-steady impulsive noise sources and are evaluated as steady noise sources with a +10 dB penalty as required by MECP guideline NPC-104.

4.3 Stationary Noise Results

Predicted stationary noise levels at the worst-case PORs of the Development are shown in Figure 4.2 and summarized as follows in terms of 1-hour Leq:

Table 4.1 Unmitigated Stationary Noise Prediction Results Summary

Worst-case Façade / POR ID	Predicted Noise Level (dBA)		Sound Level Limit (dBA)		Limits Exceeded?
	Day	Night	Day	Night	
Block 1	49	42	64	55	No
Block 2	59	51	68	62	No
Block 3	48	39	66	60	No
Block 4	56	45	66	60	No

As seen above, predicted noise levels at the worst-case PORs of the Development are within the applicable sound level limits of NPC-300. As such, the Development does not require noise mitigation measures for stationary noise impacts. Further, worst-case façade sound levels were identified after reviewing the highest noise impact which was determined by subtracting the predicted sound levels from the applicable sound level limits. Figures 4.3 and 4.4 shows the difference in the predicted sound level and applicable sound level limits for clarity.

4.4 Noise Impacts from the Development

4.4.1 Outdoor Noise Impacts

Base building cooling and ventilation systems for the Development have the potential to result in noise impacts on noise sensitive spaces within the Development itself and at existing residential uses surrounding the Site. The specific equipment selections are not available at the time of writing; therefore, it is anticipated that noise emissions from rooftop equipment will be evaluated as part of the detailed design of the Development. GHD recommends that contingencies be carried for noise controls, which may be necessary to achieve compliance with the sound level limits of NPC-300 at all worst-case points of reception both on-site and off-site, including but not limited to:

– Acoustic louvers and/or barriers to surround large rooftop mechanical equipment (e.g., cooling towers, chillers, make up air units)

– Acoustic enclosures for any standby emergency generator sets located outdoors (Level 2 minimum)
– Ventilation silencers and exhaust mufflers for any standby emergency sets located indoors
– Silencers for parking exhaust fans

Specific noise control requirements will be dependent on base building equipment locations and sound power levels, which are not available at this stage of the design. Therefore, noise emissions from on-site base building equipment should be evaluated during the detailed design phase.

4.4.2 Indoor Noise Impacts

Mechanical equipment and other building services also have the potential to cause annoyance due to noise and vibration transmission to residences. The American Society of Heating, Refrigerating, and Air conditioning Engineers (ASHRAE) guidelines specify acceptable noise levels from such equipment. Specification of noise controls (e.g., silencers, floating concrete slabs, acoustic ceilings, vibration isolators) to achieve these criteria is typically completed as part of the detailed building design, once equipment selections are made and floor layouts are more developed.

The Ontario Building Code stipulates minimum STC and apparent sound transmission class (ASTC) rating requirements for demising partitions separating residential suites from other spaces inside the building. For demising partitions separating suites from elevator shafts or garbage chutes, constructions meeting a minimum STC-55 rating must be used. For demising partitions separating suites from any other space in the building, constructions meeting a minimum STC-50 rating must be used. Suite demising partitions must also achieve a minimum rating of ASTC-47.

5. Recommendations

5.1 Building Envelope Construction

For the worst-case façades of the Development in close proximity to Highway 403/QEW, exterior vision glazing must achieve ratings of at least **STC-42**, with exterior walls rated **STC-53 or higher**. Figure 3.3 shows the preliminary minimum STC requirements throughout the façades of the Development based on assumed window-to-floor area ratios.

STC ratings recommended in this Study are preliminary and subject to change depending on actual window-to-floor area ratios and phasing of the towers, and should be updated at the detailed design stage, prior to tendering exterior glazing and architectural assemblies.

5.2 Ventilation

Central air conditioning is required to be installed prior to occupancy for all residential dwellings. This will allow windows and doors to remain closed to help ensure that the indoor sound level limits of NPC-300 are met.

5.3 Acoustic Barriers

As mentioned in Section 3.3.2, various potential OLA locations have been evaluated. It is generally recommended to select locations for outdoor amenity spaces with maximum shielding from the QEW, such as at-grade locations interior to each of the Blocks. Some podium-level amenity spaces may also be considered and would likely warrant the construction of acoustic barriers. Additionally, there is potential for OLA locations on top of the roofs of towers, provided that they are located southeast of the mechanical penthouses.

It is recommended that an updated traffic noise analysis be completed for each phase of the Development at the Site Plan Application stage, once specific locations for OLAs are known.

5.4 Warning Clauses

The following warning clauses are recommended to be included in agreements of Offers of Purchase and Sale, lease/rental agreements, and condominium declarations for all residential dwellings of the Development:

CN Rail Warning Clause (within 1000 m of ROW): "Warning: Canadian National Railway Company or its assigns or successors in interest has or have a rights-of-way within 1000 meters from the land the subject hereof. There may be alterations to or expansions of the railway facilities on such rights-of-way in the future including the possibility that the railway or its assigns or successors as aforesaid may expand its operations, which expansion may affect the living environment of the residents in the vicinity, notwithstanding the inclusion of any noise and vibration attenuating measures in the design of the development and individual dwelling(s). CNR will not be responsible for any complaints or claims arising from use of such facilities and/or operations on, over or under the aforesaid rights-of-way."

Metrolinx Warning Clause: "Metrolinx, carrying on business as GO Transit, and its assigns and successors in interest operate commuter transit service within 300 metres from the land which is the subject hereof. In addition to the current use of these lands, there may be alterations to or expansions of the rail and other facilities on such lands in the future including the possibility that GO Transit or any railway entering into an agreement with GO Transit or any railway assigns or successors as aforesaid may expand their operations, which expansion may affect the living environment of the residents in the vicinity, notwithstanding the inclusion of any noise and vibration attenuating measures in the design of the development and individual dwellings. Metrolinx will not be responsible for any complaints or claims arising from use of such facilities and/or operations on, over or under these lands."

Warning Clause Type A: "Purchasers/tenants are advised that sound levels due to increasing road traffic and rail traffic may occasionally interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment, Conservation and Parks."

Warning Clause Type B: "Purchasers/tenants are advised that despite the inclusion of noise control features in the development, sound levels due to increasing road and rail traffic may on occasions interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment, Conservation and Parks."

Warning Clause Type D: "This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment, Conservation and Parks."

Warning Clause Type E: "Purchasers/tenants are advised that due to the proximity of the adjacent commercial operations, noise from these facilities may at times be audible."

6. Conclusions

The Study concludes that the proposed development is feasible and will not be restricted by the surrounding noise and vibration impact exposures, provided that the proposed Development adheres to the noise mitigation recommended in this Study. The recommended noise mitigation at the Development consists of building envelope STC performance requirements, installation of central air conditioning, noise warning clauses, and acoustic barriers.

The Development is not anticipated to affect the ability of the nearby industrial/commercial facilities to comply with the sound level limits of the MECP.

Minimum STC Requirements Legend

	Fixed Glazing	Operable Windows	Exterior Doors	Exterior Walls
	STC-42	STC-40	STC-39	STC-53
	STC-39	STC-37	STC-36	STC-50
	STC-36	STC-34	STC-33	STC-50
	STC-33	STC-32	STC-32	STC-50

Note: Sound Transmission Class (STC) requirements shown are based on window-to-floor area ratios described in this report. If these ratios are exceeded, then upgraded STC performance requirements would apply, subject to further analysis. Additionally, phasing of the blocks or individual towers may affect the STC requirements. STC performance requirements should be reassessed at the Site Plan Approval stage for each phase.

STAMSON 5.0 SUMMARY REPORT Date: 03-10-2025 14:22:58
MINISTRY OF ENVIRONMENT AND ENERGY / NOISE ASSESSMENT

Filename: 420ssre.te Time Period: Day/Night 16/8 hours
Description: NORTHWEST WORST CASE FACADE

Road data, segment # 1: QEW (day/night)

Car traffic volume : 173272/30577 veh/TimePeriod
Medium truck volume : 10830/1911 veh/TimePeriod
Heavy truck volume : 32489/5733 veh/TimePeriod
Posted speed limit : 100 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 1: QEW (day/night)

Angle1 Angle2 : -90.00 deg 76.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 2 (Reflective ground surface)
Receiver source distance : 64.07 / 64.07 m
Receiver height : 19.50 / 19.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Road data, segment # 2: SSRE (day/night)

Car traffic volume : 4866/541 veh/TimePeriod
Medium truck volume : 0/0 veh/TimePeriod
Heavy truck volume : 57/7 veh/TimePeriod
Posted speed limit : 60 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 2: SSRE (day/night)

Angle1 Angle2 : -90.00 deg 90.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 2 (Reflective ground surface)
Receiver source distance : 25.55 / 25.55 m
Receiver height : 19.50 / 19.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Road data, segment # 3: NSRE (day/night)

Car traffic volume : 9807/1090 veh/TimePeriod
Medium truck volume : 0/0 veh/TimePeriod

Heavy truck volume : 409/45 veh/TimePeriod
Posted speed limit : 60 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 3: NSRE (day/night)

Angle1 Angle2 : -40.00 deg 27.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 1 (Absorptive ground surface)
Receiver source distance : 186.84 / 186.84 m
Receiver height : 19.50 / 19.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Road data, segment # 4: TRAF60 (day/night)

Car traffic volume : 48510/5390 veh/TimePeriod
Medium truck volume : 0/0 veh/TimePeriod
Heavy truck volume : 990/110 veh/TimePeriod
Posted speed limit : 60 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 4: TRAF60 (day/night)

Angle1 Angle2 : -90.00 deg -35.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 1 (Absorptive ground surface)
Receiver source distance : 265.95 / 265.95 m
Receiver height : 19.50 / 19.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Road data, segment # 5: TRAF50 (day/night)

Car traffic volume : 48510/5390 veh/TimePeriod
Medium truck volume : 0/0 veh/TimePeriod
Heavy truck volume : 990/110 veh/TimePeriod
Posted speed limit : 50 km/h
Road gradient : 0 %
Road pavement : 1 (Typical asphalt or concrete)

Data for Segment # 5: TRAF50 (day/night)

Angle1 Angle2 : -35.00 deg 29.00 deg
Wood depth : 0 (No woods.)
No of house rows : 0 / 0
Surface : 1 (Absorptive ground surface)
Receiver source distance : 265.95 / 265.95 m

Receiver height : 19.50 / 19.50 m
Topography : 1 (Flat/gentle slope; no barrier)
Reference angle : 0.00

Subject: FW: Ultimate AADT Traffic Data - 420 South Service Road East, Oakville
Importance: High

Hi Ben,

We do not have ultimate AADT data for South Service Road, as it is a Town-owned Road. However, for Trafalgar Road, the ultimate AADT is 55,000.
Please let me know if you have any further questions or need additional information.

Importance: High

Hi there,

GHD is working on an updated noise impact study for a proposed residential development at 420 South Service Rd E, Oakville. See location below and at the following link for reference: https://maps.app.goo.gl/9fgJY71SEUdUPPMu9

As part of the updated study, we have been asked by the peer reviewer to obtain Ultimate AADT traffic data for the regional roads. Can you please advise if this data is available, and if so please provide it as soon as you are able.

Thanks,

Ben Wiseman

image011.png
image012.png
image013.png

Hi Andrew,

Further to your request dated September 17, 2024, the subject lands (420 South Service Road E., Oakville) are located within 300 metres of the Metrolinx Oakville Subdivision (which carries Lakeshore West GO rail service).

It's anticipated that GO rail service on this Subdivision will be comprised of diesel and electric trains. The GO rail fleet combination on this Subdivision will consist of up to 1 locomotive and 10 passenger cars. The typical GO rail weekday train volume forecast near the subject lands, including both revenue and equipment trips is in the order of 408 trains. The planned detailed trip breakdown is listed below:

	1 Diesel Locomotive	1 Electric Locomotive		1 Diesel Locomotive	1 Electric Locomotive
Day (0700-2300)	132	222	Night (2300-0700)	20	34

The current track design speed near the subject lands is 80 mph (129 km/h). The track speed increases to 95 mph (153 km/h) after mile 20.8, just before trains going eastbound cross Chartwell Rd.

There are *anti-whistling by-laws* in affect near the subject lands at Chartwell Rd & Kerr St at railway crossing.

With respect to future electrified rail service, Metrolinx is committed to finding the most sustainable solution for electrifying the GO rail network and we are currently working towards the next phase.

Options have been studied as part of the Transit Project Assessment Process (TPAP) for the GO Expansion program, currently in the Development Phase. ONxpress will be responsible for selecting and delivering the right trains and infrastructure to unlock the benefits of GO Expansion. Construction to support GO Expansion is currently underway.

However, we can advise that train noise is dominated by the powertrain at lower speeds and by the wheel-track interaction at higher speeds. Hence, the noise level and spectrum of electric trains is expected to be very similar at higher speeds, if not identical, to those of equivalent diesel trains.

Given the above considerations, it would be prudent at this time, for the purposes of acoustical analyses for development in proximity to Metrolinx corridors, to assume that the acoustical characteristics of electrified and diesel trains are equivalent. In light of the aforementioned information, acoustical models should employ diesel train parameters as the basis for analyses. We anticipate that additional information regarding specific operational parameters for electrified trains will become available in the future once the proponent team is selected.

Operational information is subject to change and may be influenced by, among other factors, service planning priorities, operational considerations, funding availability and passenger demand.

It should be noted that this information only pertains to Metrolinx rail service. It would be prudent to contact other rail operators in the area directly for rail traffic information pertaining to non-Metrolinx rail service.

I trust this information is useful. Should you have any questions or concerns, please do not hesitate to contact me.

Best,

Jenna Auger (She/Her)

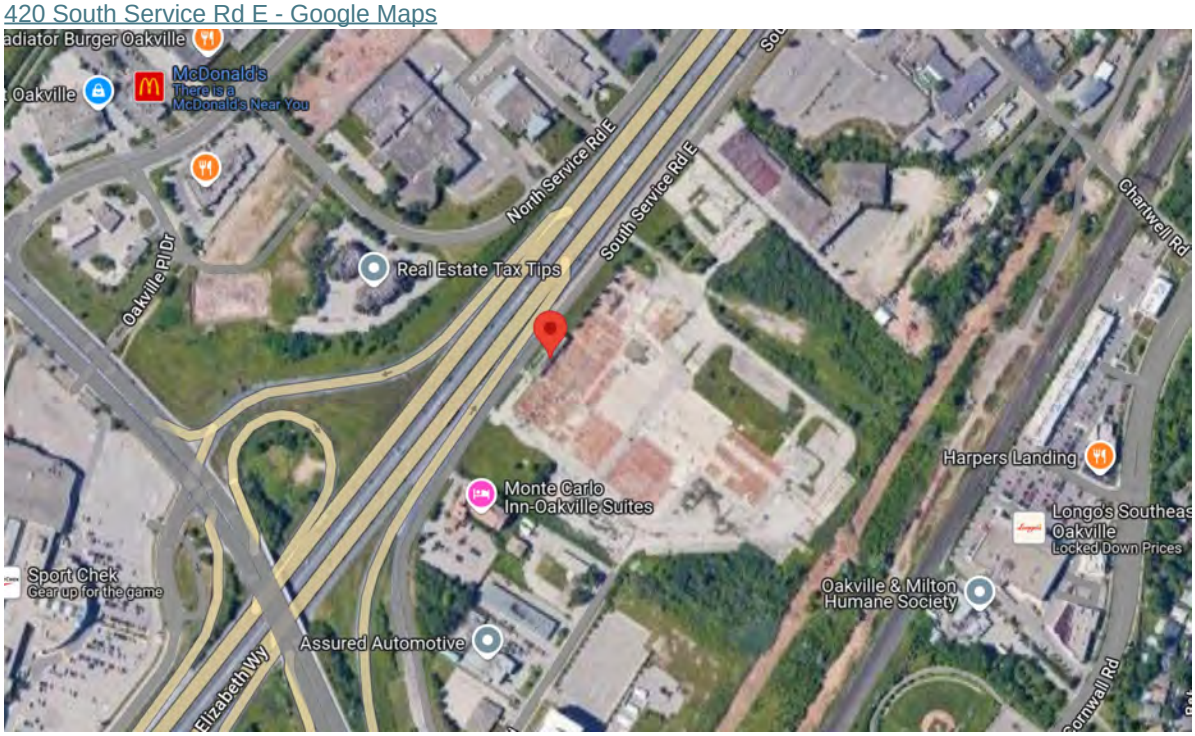
Subject: Traffic Data Request - 420 South Service Road East, Oakville

Hi there,

GHD is working on a noise study for a proposed development located at 420 South Service Road East in Oakville, Ontario. As part of this study, we need to evaluate rail noise impacts from the GO trains operating on the adjacent Oakville Subdivision rail line. Could you please provide the rail traffic data for this section of the rail line?

For ease of reference, please use the following link which indicates the approximate location of the site:
420 South Service Rd E - Google Maps



A timely response would be much appreciated.

Thanks,

Andrew DeFaria

Re: Train Traffic Data – OAK-20.81- 420 South Service Road East, Oakville ON

Please find attached the requested Train Traffic Data; this data does not reflect GO Metrolinx Traffic. The application fee in the amount of $500.00 +HST will be invoiced.

Should you have any questions, please do not hesitate to contact the undersigned at permits.gld@cn.ca.

Sincerely,

Sarangan Srikanth

Sarangan Srikanth
Officer Public Works – Eastern Canada
Permits.gld@cn.ca

Dear Andrew:

Re: Train Traffic Data – OAK-20.81- 420 South Service Road East, Oakville ON

The following is provided in response to Andrew's 2024/09/17 request for information regarding rail traffic in the vicinity of 420 South Service Road East, Oakville ON at approximately Mile 20.81 on CN's Oakville Subdivision.

Typical daily traffic volumes are recorded below. However, traffic volumes may fluctuate due to overall economic conditions, varying traffic demands, weather conditions, track maintenance programs, statutory holidays and traffic detours that when required may be heavy although temporary. For the purpose of noise and vibration reports, train volumes must be escalated by 2.5% per annum for a 10-year period.

Typical daily traffic volumes at this site location are as follows:

***Maximum train speed is given in Miles per Hour**

	0700-2300			
Type of Train	Volumes	Max.Consist	Max. Speed	Max. Power
Freight	0	140	60	4
Way Freight	3	25	60	4
Passenger	14	10	95	2

	2300-0700			
Type of Train	Volumes	Max.Consist	Max. Speed	Max. Power
Freight	0	140	60	4
Way Freight	4	25	60	4
Passenger	0	10	95	2

The volumes recorded reflect westbound and eastbound freight and passenger operations on CN's Oakville Subdivision.

Except where anti-whistling bylaws are in effect, engine-warning whistles and bells are normally sounded at all at-grade crossings. There are two (2) at-grade crossings in the immediate vicinity of the study area at Mile 20.55 Chartwell Road and Mile 21.94 Kerr Street. Anti-whistling bylaws are in effect at these crossings. Please note that engine warning whistles may be sounded in cases of emergency, as a safety and or warning precaution at station locations and pedestrian crossings and occasionally for operating requirements.

With respect to equipment restrictions, the gross weight of the heaviest permissible car is 286,000 lbs.

The triple (3) mainline track is considered to be continuously welded rail throughout the study area. The presence of four (4) switches located at Mile 21.92, 22.04, 22.05 and 22.13 may exacerbate the noise and vibration caused by train movements.

The Canadian National Railway continues to be strongly opposed to locating developments near railway facilities and rights-of-way due to potential safety and environmental conflicts. Development adjacent to the Railway Right-of-Way is not appropriate without sound impact mitigation measures to reduce the incompatibility. For confirmation of the applicable rail noise, vibration and safety standards, Adjacent Development, Canadian National Railway Properties at Proximity@cn.ca should be contacted directly.

I trust the above information will satisfy your current request.

Sincerely,

Sarangan Srikanth
