1.0 INTRODUCTION

1.1 Scope of Functional Servicing Report

This report has been prepared in support of the Rezoning (ZBA) and Official Plan Amendment (OPA) to permit the construction of a three-tower mixed-use condominium located at 590 Argus Road in the Town of Oakville (a copy of the preliminary Site Plan and site statistics are included in Appendix 'A'). This report discusses how the proposed site can be serviced by the existing and future infrastructure for water, wastewater, storm drainage/stormwater management, site grading, and erosion and sediment control. This report also briefly discusses the proposed local roads required as part of the Midtown Oakville EA. This report may be updated and refined as the project moves through the planning process to support the subdivision design.

Information provided in this report is based on our general knowledge of the area as well as information/drawings obtained from the Town of Oakville and the Region of Halton. Additionally, the following documents have been reviewed in support of this application:

- Stormwater Management Report, Oakville Part III Midtown EA, Town of Oakville, Cole Engineering, June 2014 (Midtown EA)
- Water and Wastewater Area Servicing Plan for Midtown Oakville, Final Report, Blue Plan Engineering, September 28, 2017 (ASP)
- Addendum to the Water and Wastewater Area Servicing Plan (ASP) for Midtown Oakville, Blue Pan Engineering, December 2020 (ASP Addendum)

1.2 Site Location and Description

The subject lands consist of 590 Argus Road in the Town of Oakville, having a total area of approximately 1.54 ha. The site currently consists of a six-storey hotel and associated parking. It is bounded to the north by the QEW and South Service Road East, 586 Argus Road to the west, Argus Road and 589 Argus Road to the south, and 226 and 234 South Service Road East to the east. A copy of the topographic survey is provided in Appendix 'A' for reference.

There is an existing 6.10 m wide easement described as Part 11 Plan 20R-15677 subject to a right-of-way as in instrument no. 105451 and 106047 that runs north south through the property. This easement contains a 600 mm diameter wide trunk sanitary sewer, and a 25 mm diameter water service.

1.3 Proposed Development

The development proposal is for three mixed-use condominium towers consisting of 1731 residential units and approximately 2394 m² of non-residential space. The building is to be constructed over six levels of underground parking which extend essentially to the property lines. A copy of the architect's site statistics is included in Appendix 'A' for detail. As this site is adjacent to an MTO corridor, a 14.0 m MTO setback is provided.

There are proposed road widenings and road realignments to Argus Road and South Service Road. As a result, the total developable area is 1.21 ha. Driveway access is provided off the realigned South Service Road at the north of the property.

2.0 ROAD NETWORK

The Midtown Oakville Class EA (approved 2014) and the Liveable Oakville Plan OPA 14 (adopted 2017) identify the local road network for the Midtown growth area. Growth Area Schedule L3 (refer to Appendix 'B') of the Liveable Oakville Plan illustrates the approximate alignments and road allowance widths of various future roads in the Midtown Oakville transportation network.

We understand based on discussions with Town staff that the exact locations of the future roads are flexible and can be fixed through the planning process; however, the proposed locations must meet the intent of both the Midtown EA and OPA 14 and be justified from a traffic and engineering perspective.

This development is impacted by the realignment of South Service Road along the north and east sides of the subject lands, and Argus Road widening to the south.

2.1 South Service Road

South Service Road is to be shifted in a southerly direction to accommodate a proposed QEW off-ramp. Preliminary design of South Service Road was undertaken by Cole Engineering as part of the Midtown EA; however, the Town of Oakville has been in ongoing discussions with MTO regarding the details of the realignment. Town staff provided the consultant team with conceptual drawings that were used to establish a future centreline and consequently the northerly and easterly limits of the development.

Appendix 'K' of the Midtown EA contains several preliminary design details for the Midtown transportation network. One such detail is the typical cross-section of South Service Road. It's worth noting that the EA identifies South Service Road as having a 16.0 m road allowance (see drawing 31 of 36, "Typical Sections", in Appendix 'B') although OPA 14 indicates an 18.0 m road

allowance. Additionally, the South Service Road typical section does not indicate any space between the sidewalk/multi-use trail and the limit of the road allowance. While the Cole Engineering centreline location has been maintained, a 16.0 m cross-section is reimagined. A conceptual road cross-section has been developed and is provided in Appendix 'G'. This road cross-section has been designed in collaboration with the developer's traffic consultant, BA Group.

2.1.1 Conceptual South Service Road Municipal Services

Storm sewers, sanitary sewers, and watermains will be provided in standard locations within the realigned South Service Road. The existing 600 mm diameter trunk sanitary sewer that is within the easement through the property will be relocated to the newly built South Service Road and the easement eliminated. Catchbasins and local storm sewers will be designed to collect and convey runoff from all storm events up to and including the 100-year. Services will connect to existing municipal services at the future intersection of South Service Road and Argus Road. The conceptual design maintains the existing sanitary, water, and stormwater catchment boundaries.

A Conceptual Servicing Design for South Service Road is provided (refer to Drawing S2).

A landowner's consortium and the Town of Oakville have engaged a consultant to prepare an Area Servicing Plan (ASP) which is being prepared for the entire Midtown Area and may evaluate how this proposed servicing design meets the overall servicing strategy for the entire Midtown core. The ASP should consider conceptual designs presented here and coordination should be undertaken refining this design though that process.

2.1.2 Conceptual South Service Road Stormwater Management

The realigned South Service Road will be designed with full stormwater management controls for quantity, quality, and water balance. The Town of Oakville requirements for stormwater management are set out in the Midtown Oakville EA Study (June 2014).

The applicable criteria are as follows:

1. Stormwater quantity Control (Peak Flow Control)

Utilize the Midtown Oakville EA Study hydrology model to demonstrate that the target flows are met for each subwatershed. Per the Midtown EA, the proposed road is to drain to Sixteen Mile Creek (Figure DAP-2). As there are no existing flood concerns for Sixteen Mile Creek in the study area, peak runoff rates from the development are to be controlled to existing rates. In addition to meeting the flows, a minimum storage requirement is 68.2 m^3/ha .

2. <u>Stormwater Runoff Volume Reduction (Water Balance)</u>

Provide retention of 5mm over the entire site area of the proposed development as per City of Toronto's Wet Weather Flow Management Guidelines (November 2006); or,

Retain stormwater onsite to achieve an equivalent annual volume of infiltration as predevelopment conditions, as per Section 3.2 of the MOE Stormwater Management Planning and Design Manual (March 2003)

3. Stormwater Quality Control

Achieve Enhanced Level 1 Protection, as per the Ministry of Environments Stormwater Management Planning and Design Manual (March 2003).

The stormwater management criteria must meet the objectives of the Midtown EA (Appendix J-Stormwater Management Report) as well as any updated Town of Oakville Stormwater Management Requirements.

Preliminary stormwater management calculations estimate a total of 91 m³ of storage is required to control the 100-year post-development runoff to the 5-year pre-development peak flow.

These stormwater management controls can be implemented through a variety of measures within the right-of-way such as underground stormwater chambers, low-impact developments, hydrodynamic separators, and/or membrane filtration devices.

A Conceptual Servicing Design for South Service Road which achieves this drainage pattern and fulfills the necessary criteria is provided (refer to Drawing S2).

2.2 Argus Road

Argus Road is proposed to be widened from a 20 m cross-section to a 27 m cross-section generally along the same centreline. The proposed widening is shared equally, 3.5 m to both the north and south properties.

The Midtown EA previously presented a "swoop" through the bend of Argus, but through discussion with Town staff, the "swoop" is no longer proposed.

A conceptual road cross-section has been developed and is provided in Appendix 'G'. At this time, no changes to the alignment of the existing municipal services are proposed. The municipal servicing design will be progressed and may be modified through the Area Servicing Plan, currently being undertaken through the Town.

3.0 MUNICIPAL WATER

The subject property will be serviced for water through the local water infrastructure on the adjacent roads. The current ASP notes there is sufficient water supply for the 2031 growth scenario, no major infrastructure is required to support development in this timeframe.

3.1 Existing Municipal Water

3.1.1 Existing Linear Infrastructure

There is an existing 900 mm diameter trunk CPP (Concrete Pressure Pipe) along the centreline of Argus Road. There is a 300 mm diameter PVC watermain on the south side of Argus Road. Record drawings (Appendix 'F') indicate a water service connection for the property from the 300 mm diameter watermain in Argus Road. The topographic survey and a field visit confirmed the presence of a valve near the property line.

There is an existing 500 mm diameter CPP trunk watermain along the south side of South Service Road within Pressure Zone 2.

Fire hydrants exist on the north and south sides of Argus Road as well as on South Service Road. Flow tests will be arranged to confirm the capacity of the existing systems and this report will be updated with the results when they are made available.

3.1.2 Existing Water Demands

Using the development area and Region of Halton design criteria (90 persons per ha for commercial), the existing domestic water usage is estimated and summarized below (see Appendix 'C' for supporting calculations).

Table 1: Existing Water Demands (L/min)

Average Daily Demand	26
Minimum Hourly Demand	26
Maximum Hourly Demand	60
Maximum Daily Demand	60

3.2 Proposed Municipal Water

All proposed services must be in accordance with the Ontario Building Code, Town of Oakville, and Region of Halton standards and requirements. A copy of the Preliminary Servicing Plan (S1) is included in Appendix 'G' and should be read in conjunction with this report.

3.2.1 Proposed Linear Infrastructure

Proposed water services consist of a 200 mm diameter fire, 150 mm diameter domestic service for the residential units, and 100 mm diameter domestic for non-residential space. Based on the heights of the buildings, a second fire service is provided as required by the OBC.

There are existing municipal hydrants within 40 m of each tower. The proposed location of the fire department connection (siamese connection) for each tower will need to be located within 45 m of a fire hydrant. Further detailed design will be completed at a later stage.

3.2.2 Proposed Water Demands

Using the development area and Region of Halton design criteria (90 persons per ha for commercial and 285 persons per ha for high-density residential), the domestic water usage is estimated and summarized below (see Appendix 'C' for supporting calculations). The fire flow is estimated for demand purposes only using the Fire Underwriter's Survey methodology and should be confirmed by a sprinkler consultant at the building permit stage.

Table 2: Estimated Water Demands (L/min)

Average Daily Demand	87
Minimum Hourly Demand	87
Maximum Hourly Demand	310
Maximum Daily Demand	195
Estimated Fire Demand (FUS 1999)	12,000
Maximum Daily Plus Fire Demand	12,195

4.0 MUNICIPAL WASTEWATER

The subject property will be serviced for wastewater through the local wastewater infrastructure on Argus Road. The current ASP notes capacity concerns for the 2031 growth scenario, and potentially some required downstream infrastructure upgrades. It is anticipated that the servicing capacity issues will be addressed in the new ASD.

All proposed services must be in accordance with the Ontario Building Code, Town of Oakville and Region of Halton standards and requirements. A copy of the preliminary Servicing Plan is included in Appendix 'B' and should be read in conjunction with this report. Existing and proposed servicing is discussed in further detail below.

4.1 Existing Municipal Wastewater

4.1.1 Existing Linear Infrastructure

There is an existing 750 mm diameter PVC sanitary sewer flowing west along the east west leg of Argus Road. This sewer drains south down Argus Road to a 600 mm PVC sanitary sewer.

The site is currently serviced through a 200 mm diameter service lateral running within an abandoned 600 mm diameter sanitary sewer which connects to the existing 600 mm diameter sanitary sewer running north-south on Argus Road.

There is an existing 600 mm diameter CPP trunk sewer running through the east portion of the site within an easement. This sewer conveys sanitary flows from existing residential lands north of the QEW. The 600 mm diameter sewer conveys flows to the 750 mm diameter sewer on the east west leg of Argus Road.

4.1.2 Existing Wastewater Demands

Using the development area and Region of Halton design criteria for commercial lands (90 persons per hectare), the estimated existing sanitary discharge is determined with 139 persons and 275 m³/cap. day (see Appendix 'D' for supporting calculations).

Table 3: Estimated Existing Wastewater Flow (L/s)Average Daily Dry Weather Flow0.44

Modified Harmon Peaking Factor	4.20
Infiltration Allowance (0.286 L/s-ha)	0.44
Peak Flow	2.25

4.2 Proposed Municipal Wastewater

All proposed services must be in accordance with the Ontario Building Code, Town of Oakville, and Region of Halton standards and requirements. A copy of the Preliminary Servicing Plan is included in Appendix 'G' and should be read in conjunction with this report.

4.2.1 Proposed Service Connections

A new 300 mm diameter PVC sanitary lateral connected to a new property line inspection manhole is proposed to service the development. The lateral will replace the existing 200 mm sanitary lateral within the abandoned 600 mm sanitary sewer and connect to the 600 mm diameter sanitary sewer on Argus Road and drains south to Cross Avenue.

4.2.2 Proposed Wastewater Demands

Using the development area and Region of Halton design criteria for commercial (based on floor area using unit rate, 90 persons per hectare) and high-rise residential (apartments exceeding six-storeys, 285 persons per hectare), the estimated proposed sanitary discharge is determined with 109 persons and 275 m³/cap. day (see Appendix 'D' for supporting calculations).

Table 4: Estimated Proposed Wastewater Flow (L/s)

Average Daily Dry Weather Flow	1.40
Modified Harmon Peaking Factor	4.05
Infiltration Allowance (0.286 L/s-ha)	0.35
Peak Flow	5.15

5.0 STORM DRAINAGE AND STORMWATER MANAGEMENT

5.1 Existing Storm Drainage

The existing site slopes generally from north to south, at an average slope at 0.5%. As mentioned, the site is currently occupied by a hotel and paved parking lot, all of which will be removed as part of the development. The existing parking lot drains using a series of catchbasins, which connect to a manhole near the southeast corner of the property. This manhole is connected to an existing 300 mm diameter storm sewer draining to the 375 mm diameter storm sewer on Argus Road. This sewer travels south through 570 Trafalgar Avenue, west through 571 & 587 Argus Road, and south, down Argus Road to Cross Avenue. The storm sewer along Argus Road drains west and outlets to 16 Mile Creek.

5.1.1 Existing Storm Service Connection

The existing site has a 300 mm diameter storm connection to a property line manhole in the southeast corner of the site. This manhole is connected to an existing 300 mm diameter storm sewer draining to the 375 mm diameter storm sewer on Argus Road. This sewer travels south through 570 Trafalgar Road, west through 571 & 587 Argus Road, and south, down Argus Road to Cross Avenue. The storm sewer along Argus Road drains west and outlets to 16 Mile Creek.

5.2 Proposed Storm Drainage

5.2.1 Proposed Storm Service Connection

A 375 mm diameter PVC storm connection along with property line inspection manhole will connect to the proposed storm sewer in South Service Road. This storm sewer connects to the

existing 375mm diameter storm sewer which services the site under pre-development conditions. The existing property line manhole and 300 mm diameter storm connection will be removed.

5.3 Stormwater Management

The Town of Oakville requirements for stormwater management are set out in the Midtown Oakville EA Study (June 2014).

The applicable criteria are as follows:

1. <u>Stormwater Quantity Control (Peak Flow Control)</u>

Utilize the Midtown Oakville EA Study hydrology model to demonstrate that the target flows are met for each subwatershed. Per the Midtown EA, the proposed development is to drain to Sixteen Mile Creek (Figure DAP-2). As there are no existing flood concerns for Sixteen Mile Creek in the study area, peak runoff rates from the development are to be controlled to existing rates. In addition to meeting the flows, a minimum storage requirement is 68.2 m³/ha.

2. <u>Stormwater Runoff Volume Reduction (Water Balance)</u>

Provide retention of 5 mm over the entire area of the proposed development as per the City of Toronto's Wet Weather Flow Management Guidelines (November 2006); or,

Retain stormwater onsite to achieve an equivalent annual volume of infiltration as perdevelopment conditions, as per Section 3.2 of the MOE Stormwater Management Planning and Design Manual (March 2003).

3. <u>Stormwater Quality Control</u>

Achieve Enhanced Level 1 Protection, as per the Ministry of Environment's Stormwater Management Planning and Design Manual (March 2003).

5.3.1 Stormwater Quantity Control (Peak Flow Control)

Pre-development flow rates are calculated using the Town of Oakville IDF curves, a runoff coefficient of C=0.5, and a development area of 1.21 ha. Post-development flow rates are calculated using the same IDF data, runoff coefficient of C=0.9 and the same area. In the determination of the post-development runoff coefficient, we have not accounted for any landscaping in the interior courtyard, or rooftop amenity space to remain conservative. This will

be refined as detailed design progresses. A conservative value of post-development runoff coefficient ensures adequate sizing of the stormwater management tank during the preliminary design stage.

Runoff from the entire site will outlet to the minor system on South Service Road. Therefore, postdevelopment peak flows must be controlled to the 5-year pre-development peak flow to respect capacity of the minor system.

To control stormwater runoff from the site, an underground stormwater tank system is proposed. The proposed stormwater management tank system will pump stormwater to the storm connection to South Service Road. The maximum pump release rate is the 5-year predevelopment peak flow. A comparison of pre- and post-development flow is provided in the table below.

Table 5: Stormwater Flows

	Pre-Dev Total	Post-Dev Release	Storage Required
Return	(L/s)	(L/s)	(m ³)
5-yr	192	192	102.6
10-yr	226	192	150.0
25-yr	300	192	254.4
50-yr	367	192	314.8
100-yr	421	192	368.2

The minimum storage requirement per the Midtown Oakville EA is 69.6 m³. The post- to predevelopment storage requirements yield a higher storage requirement and therefore govern.

The runoff coefficient and associated tank sizing may be refined as detailed design progresses.

Runoff from the site will be collected through the roof drains and surface drains. Plumbing interior to the building and underground parking structure (designed by the mechanical engineer) will direct runoff to the stormwater tank located in the underground parking structure and must be sized to capture the 100-year event. An emergency overland flow route is provided through the site to Argus Road. An emergency overflow from the tank must be designed in coordination with the mechanical consultant at the detailed design stage but will likely discharge to grade in the general vicinity of the tank.

5.3.2 Stormwater Runoff Volume Reduction (Water Balance)

A retention of 5 mm is required as per the Midtown EA hydrology study. However, in discussions with the Town, staff have recommended using a retention of 25 mm (refer to correspondence in Appendix 'G'). Accordingly, we have estimated a 25 mm retention volume of 302.2 m³ which must be re-used.

The stormwater management tank has been sized to store this volume in addition to the volume required for peak flow control. There are limited opportunities for infiltration, so the re-use water will be used for onsite irrigation or other acceptable best efforts. Additional details will be provided through detailed design.

5.3.3 Stormwater Quality Control

The Town of Oakville requires that the development meet MECP Enhanced protection (80% longterm removal of TSS). A Stormceptor Jellyfish (or approved equivalent) is proposed to treat sediment laden runoff from the vehicular and at-grade pedestrian areas only. Clean roof drainage is to bypass the filtration system. The Jellyfish is to be located upstream of the stormwater management tank and is provided with an outlet pipe and an overflow weir, both directed to the tank. An adequately maintained filtration system provides 80% long-term removal of TSS. Sizing of the Jellyfish will be undertaken as the detailed design progresses.

6.0 **GROUNDWATER**

A Hydrogeological Investigation was performed by B.I.G. Consulting Inc. (dated February 2023) in which the long-term peak groundwater flow rate into the parking garage sub drains after initial dewatering stages was estimated to be 75,000 L/day (0.87 L/s). These flows may be treated and may be to the stormwater management tank system in the underground parking garage before being discharged using the proposed stormwater lateral.

In the event that permanent dewatering is not permitted, the proposed building may be designed and supported by "tanked" water-proofed continuous raft foundation without permanent dewatering.

Refer to the Hydrogeological Investigation prepared by B.I.G. Consulting Inc. (BIGC-ENV-554A) dated February 2023 for details.

7.0 SITE GRADING

The proposed grading must ensure that drainage from the 100-year event is collected by the building's mechanical system and conveyed to the stormwater management tank. All building air intake and exhaust shafts must be protected from overland flow by being set a minimum of 0.2 m above the spill elevation.

The proposed property line elevations adjacent to South Service Road have been set considering the preliminary future road centerline elevations as set out in the Midtown Oakville EA.

Proposed grades along the south limit of the property have been set considering the future road alignment of Argus Road and are generally compatible with the existing grades.

A copy of the Preliminary Grading Plan is provided in Appendix 'G' and should be read in conjunction with this report.

8.0 EROSION AND SEDIMENT CONTROL

Erosion and sediment controls must be installed prior to the commencement of any construction. The erosion and sediment control devices should follow the Erosion and Sediment Control Guidelines for Urban Construction as set out by the Greater Golden Horseshoe Conservation Authority. Erosion and sediment control measures may be implemented as follows:

- Double wrapped catch basins: The proposed storm sewer catch basins and catch basin manholes located within the subject site and adjacent municipal roads shall be double wrapped in a woven geotextile material. Woven geotextile material is to be replaced periodically when accumulated sediments interfere with drainage. The abutting streets should be monitored and if required, swept to mitigate the accumulation of tracked material on the roads on a routine basis in keeping with good construction housekeeping practices.
- Gravel Access Pad: A gravel access (mud) mat will be installed at the entrance to the construction zone to prevent mud tracking from the site to the municipal roads.
- Silt Fencing: Silt fence will be installed along the property line to intercept sheet flow.

A detailed erosion and sediment control plan and phasing plan (if applicable) will be developed through detailed design and provided at the site plan stage.

9.0 CONCLUSION

The information presented in this Functional Servicing Report demonstrates that the proposed development can be serviced by the existing and future adjacent infrastructure for water, wastewater, stormwater and can meet the Town of Oakville stormwater management criteria.

The following is a summary of the report findings:

- As part of the Midtown Oakville EA, the Argus Road and South Service Road realignment and dedications are required to develop the property.
- Separate stormwater controls are proposed for runoff from South Service Road.
- There is existing municipal water infrastructure adjacent to the site that can readily service the site. The proposed average daily water demand for the site is 84 L/min with an estimated maximum daily plus fire demand of 12,189 L/min.
- There is existing wastewater infrastructure servicing on Argus Road adjacent to the site. The proposed development will be serviced off this existing infrastructure by way of a 300 mm diameter sanitary lateral. The estimated peak wastewater flow based on Region of Halton criteria is 6.0 L/s for the entire site.
- Stormwater quantity controls will be provided by controlling post development peak flows to the 5-year pre-development peak flow. Storage will be provided in a stormwater tank located in the underground parking structure. Stormwater will be pumped to a maximum release rate of 192 L/s to South Service Road by way of a 375 mm diameter storm sewer connection. The required storage volume is 368.2 m³.
- The water balance criteria of 25 mm is equivalent to 302.2 m³. This water will also be stored in the underground stormwater tank and will be re-used for irrigation and other best efforts to be determined at the detailed design stage.
- The stormwater tank will have a minimum capacity of 670.4 m³, to store the required quantity and water balance requirements.
- Water quality criteria is met by means of a stormwater filtration system (Jellyfish unit), placed upstream of the stormwater tank.
- Grading of the site is designed to ensure runoff from the 100-year event is captured, and there is an emergency overland flow route.

Functional Servicing Report Proposed Mixed-Use Condominium 590 Argus Road, Oakville, ON

• Erosion and sediment controls will be implemented during construction in accordance with the Erosion and Sediment Control Guidelines for Urban Construction as set out by the Greater Golden Horseshoe Conservation Authority.

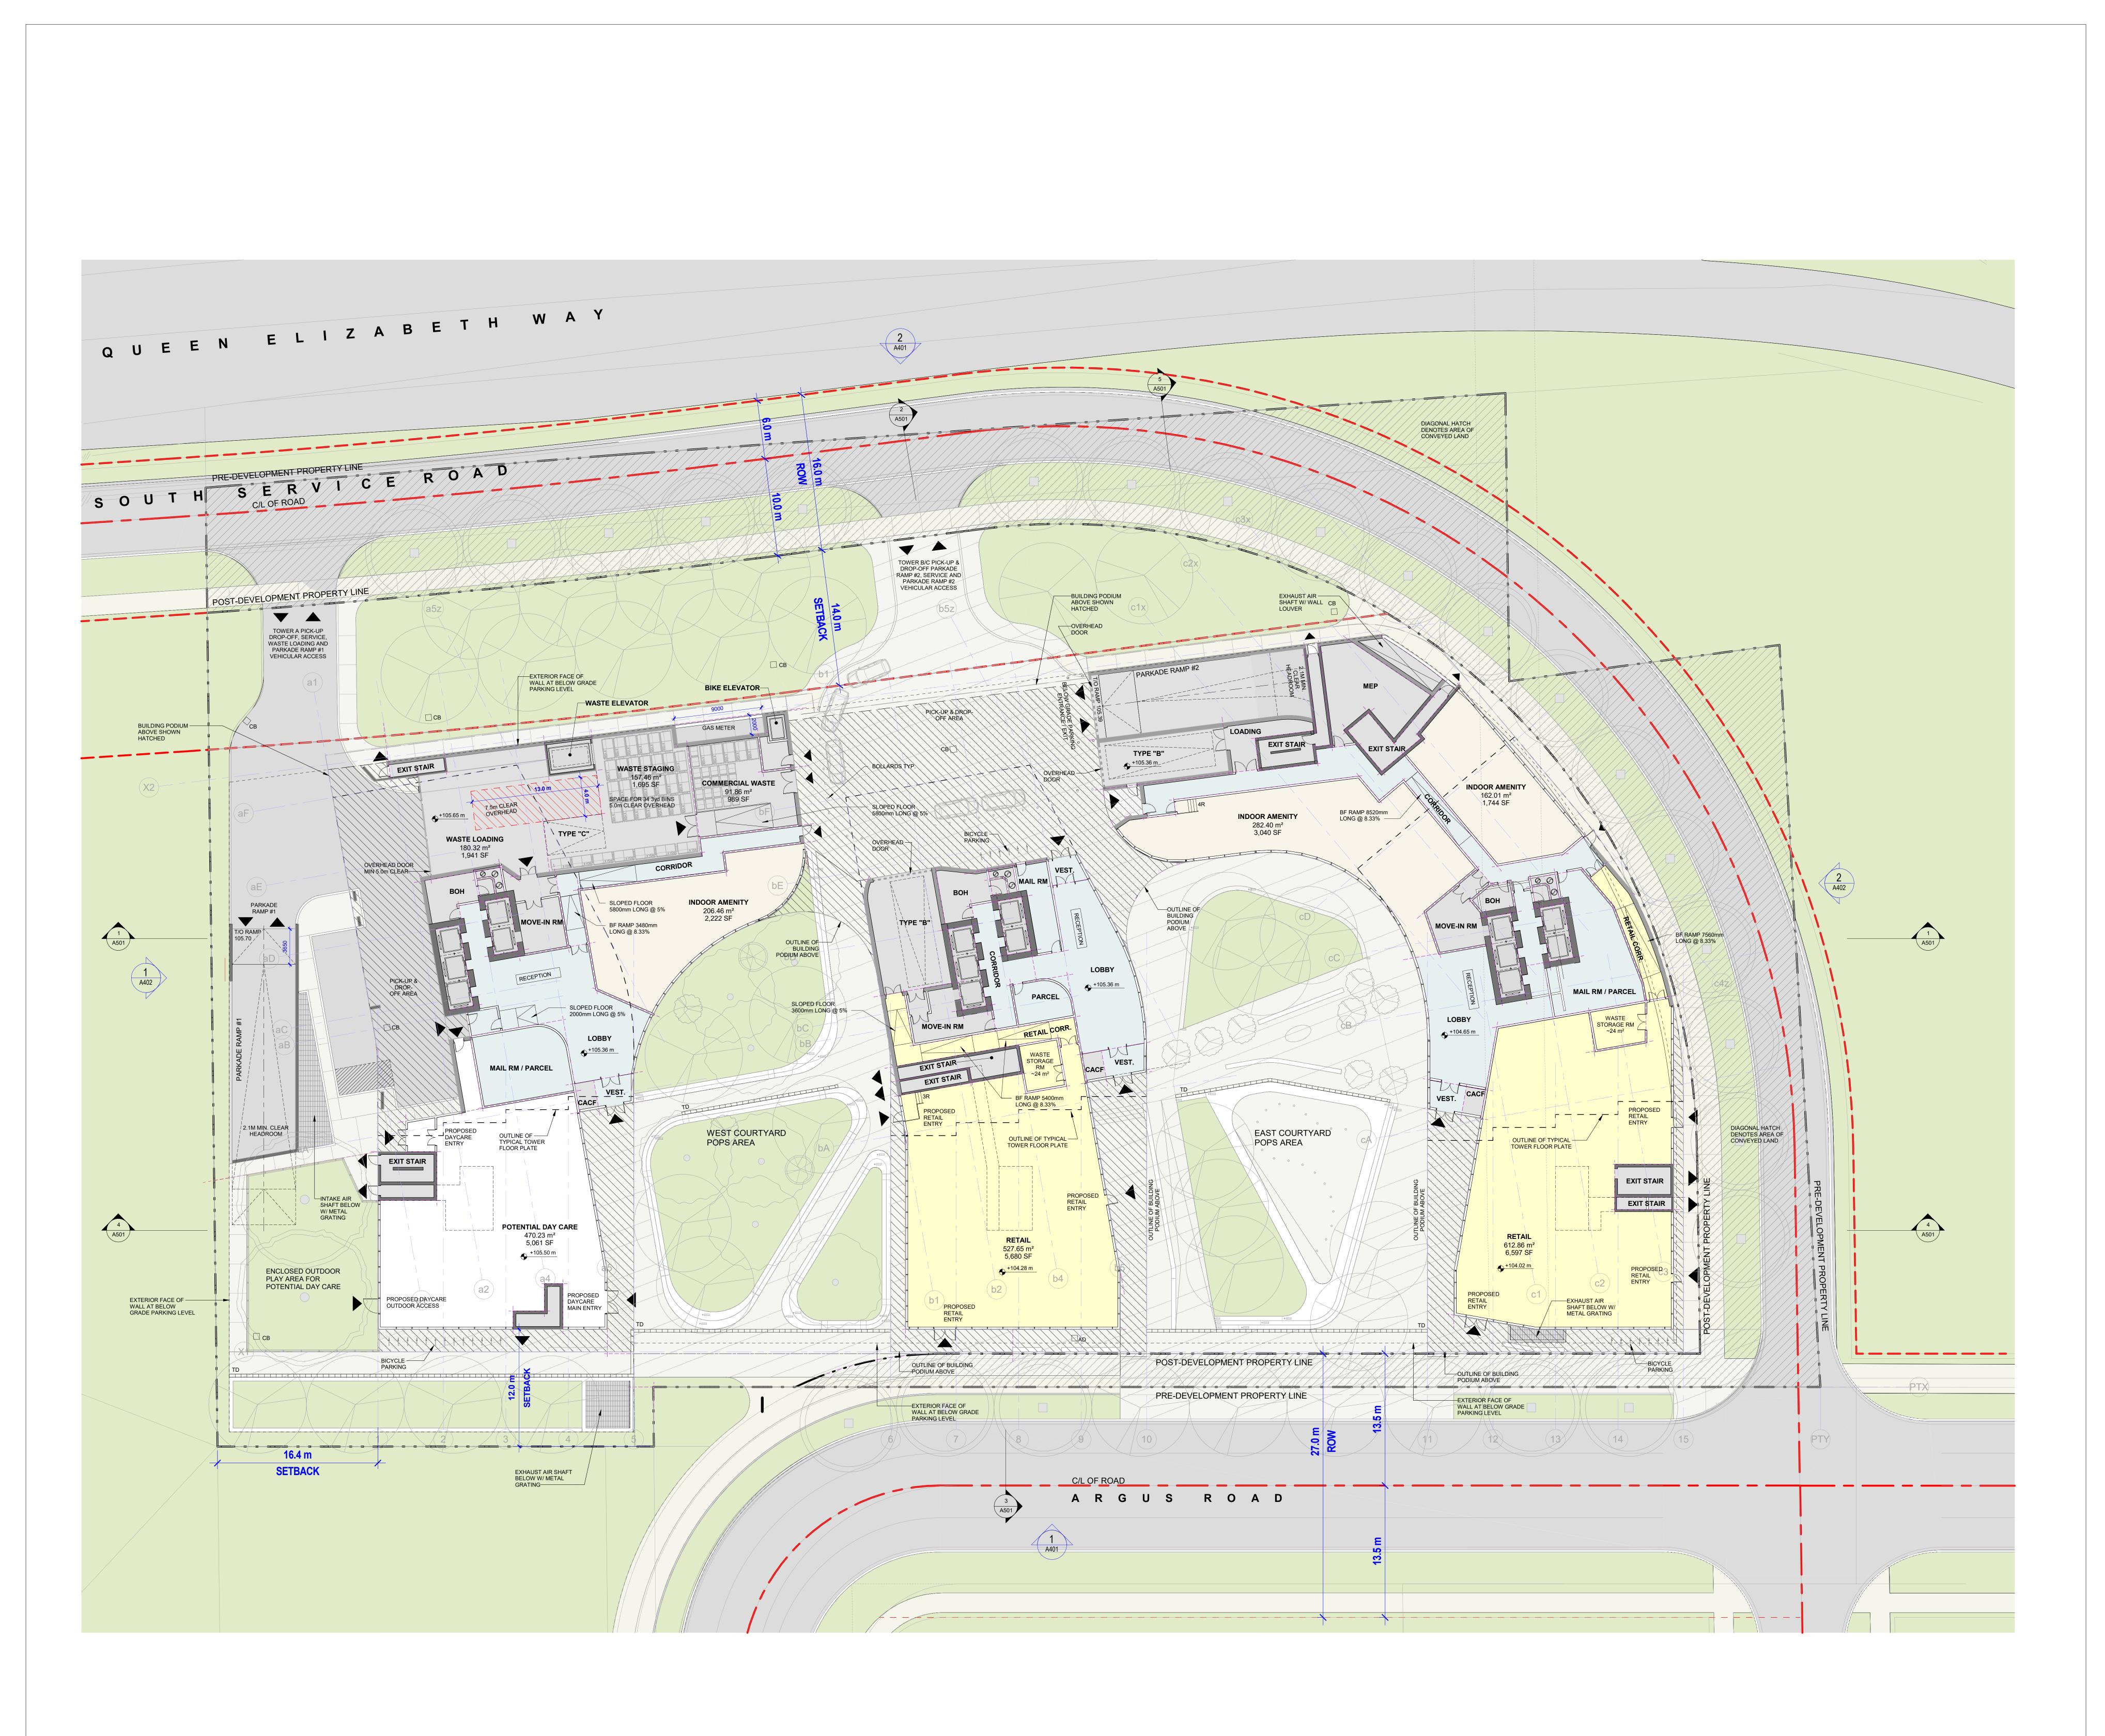

Based on the above, we support the proposed development from a civil engineering perspective for rezoning and Official Plan Amendment.
